V. LEAST COST INTEGRATED RESOURCE PLAN (LCIRP) 23

VI. CONCLUSION 32

THIS PAGE INTENTIONALLY LEFT BLANK

1 **I. INTRODUCTION AND BACKGROUND**

2 **Q. Mr. Rivera, please introduce yourself.**

3 A. My name is Joel Rivera, my business address is 9 Lowell Road, Salem, New Hampshire,
4 and I am employed by Liberty Utilities Service Corp. I am the Manager of GIS and
5 Electric System Planning for Liberty. I am responsible for managing the Company's
6 electric system capacity, reliability, integrity, interconnections, protection systems,
7 equipment and system upgrades, prioritization, and associated budget estimates. Please
8 see the Direct Testimony of Joel Rivera, Anthony Strabone, and Heather M. Tebbetts,
9 filed April 30, 2019, for a description of my educational background and work
10 experience.

11 **Q. Ms. Tebbetts, please state your full name, business address, and position.**

12 A. My name is Heather M. Tebbetts, my business address is 15 Buttrick Road, Londonderry,
13 New Hampshire, and I am employed by Liberty Utilities Service Corp. I am Manager of
14 Rates and Regulatory Affairs and am responsible for providing rate-related services for
15 the Company. Please see the Direct Testimony of Joel Rivera, Anthony Strabone, and
16 Heather M. Tebbetts, filed April 30, 2019, for a description of my educational
17 background and work experience.

1 **II. PURPOSE OF TESTIMONY**

2 **Q. What is the purpose or your testimony?**

3 A. Our testimony is provided in rebuttal to the Staff witnesses Jay E. Dudley and Kurt
4 Demmer related to the topics of planning criteria, Least Cost Integrated Resource Plan
5 (“LCIRP”), and Salem Area Study.

6 **III. SALEM AREA PROJECTS**

7 **Q. What is Staff’s overall recommendation for the Salem Area?**

8 A. Staff believes that Liberty’s planning criteria is too conservative and the proposed loads
9 at Tuscan Village Development are speculative. This position inappropriately disregards
10 all forecasted loading and the 37 criteria violations – exceeding normal rating and
11 exceeding load at risk – identified by Liberty, and downplays the need for major
12 infrastructure improvements needed at Golden Rock and Rockingham to meet the
13 growing demand in the town of Salem. A “criteria violation” occurs when the demands
14 on the system force a particular piece of equipment to operate above the specified limit
15 for normal or contingency loading which poses heightened risk to a large number of
16 customers. The loading limits for normal and contingency loading are specified in the
17 Company’s Distribution Planning Criteria.

18 In addition, Staff believes that the Barron Ave and Salem Depot Substations are adequate
19 for the electric service they are providing¹ and found no evidence of significant

¹ Direct Testimony of Kurt Demmer, Bates Page 26, Lines 11–12.

1 maintenance, repair, or performance issues,² even though Staff did not present testimony
2 of a qualified substation assessor in support of refurbishment.³

3 After discrediting all capacity and asset condition issues in the Salem Area, Staff then
4 recommends serving the Tuscan Village load at 23kV⁴ even though it appears Staff lacks
5 granular feeder information and field condition information⁵ to make such a
6 determination. Further, given the planned load additions in the area, Liberty identified
7 nine criteria violations for supply line or transformer load at risk for the 23kV system
8 (Table 2, Lines 14–22), which clearly indicate that the 23kV cannot support the addition
9 of 17MW project for the Tuscan Village development. Of these nine 23kV supply
10 violations, six would also be considered in violation using National Grid’s former criteria
11 (Table 2, Lines 14–17, 21–22).

12 **Q. Staff claims that the load additions for the Tuscan Village Development are**
13 **speculative. Are the Tuscan Village investments the subject of this case?**

14 **A.** No, at least with respect to the 2018 rate base. However, Tuscan Village investments do
15 come into play with respect to the Company’s requests for a step adjustment for 2019
16 capital investments and future step adjustments as part of a Multi-Year Rate Plan.

² Direct Testimony of Kurt Demmer, Bates Page 26, Lines 6–7.

³ Response to Liberty Utilities Set 1 Data Request 1–41.

⁴ Direct Testimony of Kurt Demmer, Bates Page 28, Lines 3–7.

⁵ Response to Liberty Utilities Set 1 Data Request 1–37.

1 **Q. Does the Company agree with the Staff's that the Tuscan Village Development load**
2 **is speculative?**

3 A. No, we do not. The investment necessary to serve the Tuscan Village Development is far
4 from speculative. Liberty meets regularly with the developers to discuss electric service
5 needs and to update loading projections. The loading estimates are determined
6 consistently for all service requests the Company receives and the loading estimated for
7 Tuscan Village was no different. Liberty personnel have many years of utility experience
8 and act in good faith with all customer service requests.

9 Mr. Demmer considers the loading projections to be speculative and not guaranteed to be
10 in service any time in the near future.⁶ Given this position, Staff rejects the load
11 estimates developed for Tuscan Village and ignores Liberty's forecasted planning criteria
12 violations given these load additions.⁷

13 **Q. At which point in the process does Staff consider proposed loads to no longer be**
14 **speculative?**

15 A. Considering Mr. Demmer's testimony and responses to discovery where he repeatedly
16 referred to the loads at Tuscan Village as speculative, during the technical session held on
17 January 14, 2020, he was asked to clarify at what point expected load should no longer be
18 considered speculative. He stated that the load is no longer speculative once foundations
19 have been poured and distribution transformers have been ordered. This is unrealistic as
20 applied to the Tuscan development given the long lead time needed to construct the

⁶ Direct Testimony of Kurt Demmer, Bates page 27, lines 6-7.

⁷ Direct Testimony of Kurt Demmer, Bates page 27, lines 16-17

1 facilities required to supply a development in the range of 17 MW and to meet customer
2 expectations and in-service dates while leveraging some projects to resolve multiple
3 forecasted criteria violations and asset condition of existing equipment. The Company
4 needs to plan and build ahead in order to remain synchronous with developer schedules.
5 Staff has been aware of Liberty's plan for the Salem Area and changes to its planning
6 criteria since 2016.

7 **Q. What are the existing criteria violations in the Salem Area, based on 2019 peak**
8 **loading conditions?**

9 A. Liberty has identified eight violations to its distribution planning criteria in 2019.

10 Under normal conditions there are five criteria violations due to feeder or transformer
11 loading levels above 75% of their summer normal rating. Please refer to Table 1 below,
12 lines 1, 4, 6, 8, and 13. There are no violations due to feeder loading levels above 100%
13 of summer normal rating. These five existing violations can be resolved with performing
14 load transfers in the field.

15 Under contingency conditions, there are three criteria violations due to load at risk. The
16 Pelham 14L1 and 14L2 feeders currently experience load at risk above the 16 MWhr
17 limit with each having a load at risk of 20 and 16.8 respectively. The supply line to
18 Spicket River also experiences load at risk above the 1.5MW/36 MWhr limit, having a
19 load at risk of 11.87MW/160MWhr. The issue with Spicket River load at risk is further
20 explained in this testimony.

1 It is worth noting that Liberty extended the Pelham 14L4 feeder into the Town of Salem
2 to allow transferring load from Golden Rock to Pelham. In 2019 these transfers started
3 taking place, which resulted in approximately 300A or 6.9 MVA of Golden Rock load
4 transferred to Pelham. Additional transfers from Golden Rock to Pelham are planned for
5 2020 to create additional capacity on the 13kV and 23kV for Tuscan Village. The
6 Company installed the 14L4 feeder to reduce the load at risk from Golden Rock and to
7 provide additional temporary capacity for Tuscan Village until the Rockingham
8 Substation can be built. Without the Rockingham Substation, the Tuscan Village
9 Development will not be able to fully expand. The existing and forecasted criteria
10 violations (presented below) reflect the 6.9 MVA load transfer from Golden Rock to
11 Pelham.

12 **Q. What are the criteria violations that are forecasted to occur in 2022 given the**
13 **planned load additions in the Salem Area?**

14 A. There are many criteria violations that are forecasted to occur in 2022 in the Salem Area
15 given the Company's load forecast, planned load additions from the Tuscan
16 Development, and other planned expansions. For a summary of criteria violations that
17 are forecasted to occur in 2022, see the tables below. Table 1 identifies the criteria
18 violations that result under normal operating conditions. Table 2⁸ identifies the criteria
19 violations that result under contingency (n-1) conditions.

⁸ Information under lines 18, 19, and 22 has been updated as compared to Attachment Staff 1-31.xls provided as Company's response to Staff Technical Session Data Requests - Set 1, 1-31.

1

2

Q. Which of criteria violations above directly result from the change to Liberty’s previous planning criteria, and what are the Company’s plans to address these violations that resulted from a change to the planning criteria?

3

4

5

A. Under normal conditions, the Company identified 15 violations of its new planning criteria in 2022, identified in Table 1 above. Six are violations due to feeder or transformer loading at or above 100 percent of its rating. Nine are violations due to feeder or transformer loading between 75 and 99 percent of their summer normal rating.

6

7

8

1 These nine would not be considered violations under Liberty's previous criteria and
2 formerly employed at National Grid. However, from these nine violations, only the
3 Golden Rock T1 violation (line 10) is a result of the planned load additions at the Tuscan
4 Development, while the other nine are violations that result from the general area load
5 growth forecast and can be easily resolved by switching. The violation on the Golden
6 Rock T1 due to load at risk cannot be easily resolved without major infrastructure
7 additions at Golden Rock and Rockingham. See Attachment RT-1 for additional details
8 regarding the criteria violations for the Salem Area in 2022 given the planned load
9 additions and forecasted load growth.

10 Under contingency conditions, there are 22 violations identified for 2022 in Table 2
11 above. Three are for load at risk that complies with the allowable amount provided in
12 National Grid's previous criteria (240MWhr), but out of compliance with Liberty's
13 updated planning criteria (60MWhr and 36MWhr). See lines 18–20. The remaining 18
14 violations are out of compliance with both previous and updated planning criteria as they
15 are above 240MWhr. These violations cannot be easily resolved without major
16 infrastructure additions at Golden Rock and Rockingham. These high levels of load at
17 risk are not risks that Liberty is willing to accept given its Corporate vision to continually
18 improve reliability and become "local and responsive" to the communities we serve. As
19 such Liberty will address all identified criteria violations in the Salem Area consistent
20 with its Commission-approved planning criteria and company strategies by expanding the
21 Golden Rock Substation and installing the new Rockingham Substation.

1 In summary, out of the 37 criteria violations identified in Tables 1 and 2 above for 2022,
2 nine are due to changes in planning criteria for normal loading (75%), and three are due
3 to changes in planning criteria for contingency loading.

4 **Q. What is the estimated cost related to the change to Liberty's Planning Criteria as it**
5 **relates to the Salem Area, and how does this compare to the Company's previous**
6 **estimate performed in 2016?**

7 A. This is difficult to estimate given that the proposed projects for Golden Rock and
8 Rockingham address a number of issues as a whole including criteria violations related to
9 normal loading and contingency loading, asset condition, and service delivery to Tuscan
10 Village Development. However, it is possible to estimate the impact that the change to
11 the Planning Criteria will have to the Salem Area by making the following assumptions
12 and observations regarding the proposed scope of projects and forecasted criteria
13 violations:

- 14 • Two of three feeders at Golden Rock target to resolve Asset Condition at Baron
15 Ave. One feeder targets a reduction in Load at Risk at Spicket River.
- 16 • Three of six feeders at Rockingham target to resolve Asset Condition at Salem
17 Depot. One feeder targets reduction in Load at Risk at Spicket River and two
18 feeders will be dedicated to supply the Tuscan Village Development.
- 19 • One of seven reported criteria violations for normal loading conditions result from
20 a change to the planning criteria. Note that eight criteria violations for normal
21 loading are not considered for purposes of this estimate as these eight violations

1 can be resolved with performing load transfers in the field and will not likely
2 result in capital additions. Three of twenty-one reported criteria violations for
3 contingency loading conditions result from a change to the planning criteria.

4 Given these assumptions, Liberty estimates the cost of the change in its planning criteria
5 to be approximately \$800,000 through the scheduled end of the Rockingham Project in
6 2023, which is lower than its 2016 estimate of \$4.8 million for the Salem Area.

7 **Q. Please provide a summary of the present load at risk at the Spicket River Substation**
8 **and the forecasted load at risk in 2022 after the proposed load additions in the**
9 **Salem Area.**

10 A. At present, loss of the 23 kV sub-transmission supply circuit to the Spicket River No.13
11 Station would result in approximately 11.87 MVA of load at risk, after restorative
12 switching occurs. Liberty relies on the transmission provider, National Grid, to expedite
13 repairs should an outage-related problem occur anywhere along the 4.2 miles of National
14 Grid-owned 2376 sub-transmission line downstream of the 2376/2353 tie. This could
15 cause Liberty to have up to 160 MWHrs of load at risk, for an assumed repair time of 12
16 hours, which violates Liberty's planning criteria.

17 In 2022, after planned load additions in the Salem area, loss of the 23 kV sub-
18 transmission supply circuit to the Spicket River No.13 Station would result in
19 approximately 22.2 MVA of load at risk, after restorative switching occurs. This could
20 cause Liberty to have up to 275 MWHrs of load at risk, for an assumed repair time of 12

1 hours, which violates both Liberty's current planning criteria and National Grid's
2 planning criteria.

3 **Q. What is Staff's position regarding the present load at risk at Spicket River**
4 **Substation?**

5 A. Staff believes that Liberty's approved planning criteria is too conservative as compared to
6 their preferred 30MW/720MWhr criteria employed at other utilities.⁹ Liberty believes
7 that the former planning criteria utilized by National Grid (which was used by Liberty
8 until the Commission approved the current planning criteria in 2017) and the criteria used
9 by Eversource and Unitil are not appropriate for a system the size of Liberty's.
10 According to the former criteria utilized by National Grid, the transmission provider is
11 required to return the failed sub-transmission line to service within 12 hours and is
12 allowed 240 MWHrs of load at risk. A more conservative approach should be taken in
13 Liberty's case since the 23 kV supply line feeding Spicket River Station is a sole source
14 circuit without any contingency sub-transmission backup within Liberty's operating
15 territory. This will eliminate reliance on the transmission provider and allow Liberty to
16 significantly reduce load at risk.

17 In addition, Staff argues that 13kV distribution ties between Liberty and National Grid
18 should be used in calculation of load at risk,¹⁰ even though these ties are located outside
19 of Liberty's service territory, are of limited capacity (2.5 MVA), and are not guaranteed

⁹ Direct Testimony of Kurt Demmer, Bates Page 23, lines 13–18.

¹⁰ Direct Testimony of Kurt Demmer, Bates Page 23, Lines 1–5

1 during a large scale event. Liberty disagrees with this position, but for the sake of
2 discussion offers the following regarding this additional capacity.

3 At present, loss of the 23 kV sub-transmission supply circuit to the Spicket River No.13
4 Station would result in approximately 9.1 MVA of load at risk, after restorative switching
5 occurs including transfers to National Grid. This could cause Liberty to have up to 131
6 MWHrs of load at risk, for an assumed repair time of 12 hours, which still violates
7 Liberty's planning criteria.

8 **Q. Have there been any recent outages along the 4.2 miles of National Grid's**
9 **transmission owned 2376 line that supplies Spicket River?**

10 A. Yes. During Winter Storm Quinn (March 7–11, 2018), National Grid's transmission line
11 that supplies Spicket River lost power, resulting in delays to restoring power to the
12 customers. Following this major event the Public Utilities Commission stated the
13 following:

14 The Commission also notes that Liberty's restoration efforts were 25%
15 longer in duration than those of other utilities, and that the Town of Salem
16 was the only community in New Hampshire that needed to open a shelter
17 during the event due to the cold temperatures experienced during the
18 extended power outage. In order to improve the Company's future
19 restoration efforts, the Commission has determined that the completion of a
20 self-assessment would be useful to the Commission as well as the Company.

21 See Attachment RT-2, *Winter Storm Quinn – March 2018 After Action Report for Liberty*
22 *Utilities*. Some of the relevant issues presented by the Commission were as follows:

- 1 • Liberty’s attempt to facilitate restoration with National Grid of the 23kV supply
2 line originating at Pie Hill in Methuen and providing power to the Spicket River
3 Substation.
- 4 • The Commission’s understanding is that the restoration of that substation feed
5 would significantly restore the affected circuits out of the Spicket River substation
6 and shorten outage durations in the North Main Street and Main Street areas
7 accordingly.
- 8 • Restoration efforts coordinated with National Grid, including switching attempts
9 employed by Liberty to restore power within Liberty’s distribution system in lieu
10 of National Grid’s prolonged restoration efforts.

11 This is the same contingency scenario that Liberty is attempting to mitigate at Spicket
12 River. After Quinn, it was clear to Liberty that the Commission was not pleased with the
13 prolonged restoration times due to lack of feeder ties, delays in returning National Grid’s
14 line back to service, and the difficulties in communicating with National Grid during this
15 major event. It is unclear why Staff now believes that the present load at risk condition at
16 Spicket River is no longer an issue because our planning criteria for load at risk is too
17 conservative.

1 **Q. What is Staff's estimate for the Tuscan Village Development ultimate loading?**

2 A. Staff estimates the ultimate load at Tuscan Village to be approximately 12 MW¹¹,
3 although that is speculative given that the estimate is based on the South side of the
4 development having approximately 3-4 times the buildings that the North side contains.¹²

5 Liberty disagrees with this assumption but, for purposes of comparison, offers the
6 following. Assuming a peak load of 12MW for Tuscan Village, nearly all of the planning
7 violations discussed above under a peak load of 17MW will still occur. Tables 1 and 2
8 above have been modified to include a comparison between 17MW and 12MW load
9 projection for Tuscan Village. See Tables 3 and 4, respectively.

1

2 Under normal operating conditions seen in Table 3 above, violations under lines 3, 10,

3 and 12 improve but are still in violation of Liberty’s planning criteria. Feeders that were

4 previously forecasted to be loaded above 100% of their normal rating are still forecasted

5 to be above 100% (Table 3 - Lines 3 and 12). Feeders that were previously forecasted to

6 be loaded to above 75% are still above 75% (Table 3 – Line 10). Out of 15 violations

7 when one assumes a 17MW load, *all* remain in violation of Liberty’s Planning Criteria

8 when the Tuscan load estimate is reduced to 12MW.

1 Under Contingency conditions seen in Table 4 above, there are improvements to the
2 violations listed under lines 2, 3, 7, 14, 15, and 17 through 21, but they are still in
3 violation of Liberty's planning criteria. Feeders that were previously forecasted to have
4 over 16 MWhr of load at risk (Table 4, Lines 1–13), still are forecasted to be over 16
5 MWhr. The Golden Rock Transformer (Table 4, Line 14) is still forecasted to have load
6 at risk in excess of Liberty's and National Grid's planning criteria. The supply lines
7 (Table 4, Line 15–22) are also still forecasted to have load at risk in excess of Liberty's
8 planning criteria for supply lines (36 MWhr). As mentioned, the forecasted supply line
9 contingency violations on Table 4, lines 18–20, are within National Grid's criteria. The
10 major benefit to a 12MW load projection for Tuscan Village is for violations listed on
11 Table 4, lines 18–20. These results are very close to Liberty's criteria of 36 MWhr for
12 supply lines. Out of 22 violations, *all* remain in violation of Liberty's Planning Criteria.

13 The results above indicate that a load projection comparison between 12MW and 17MW
14 for Tuscan Village ultimately has little effect on the overall impact to the distribution
15 system. This comparison also indicates that the distribution system is nearly at the
16 tipping point where major infrastructures are needed to support future load growth and
17 customer expansions in the area and that, even with a 12MW load forecast for Tuscan,
18 the project needs and drivers remain the same given minimal improvement to the
19 violations.

1 **IV. ASSET CONDITION SALEM DEPOT AND BARRON AVE**

2 **Q. Please summarize the asset conditions that exist at Salem Depot and Barron Ave**
3 **Substations.**

4 A. As discussed with Staff during the 2016 rate case proceedings, the existing substation
5 assets at Barron Avenue and Salem Depot have exceeded both their useful operating lives
6 and their useful economic lives.¹³ The Company has conducted an asset review at each
7 location, and determined those assets are in need of replacement in the near future, which
8 is the case regardless of future load growth. Those assets are continuing to deteriorate.
9 The piece-out replacement of individual components at these locations does not make
10 good economic sense for a number of reasons, including the limited size and location of
11 the substations; the limited capacity of the equipment; their reliance on sub-transmission
12 supply; the condition of electrical equipment; clearance requirements; access and abutter
13 concerns; vintage control, data, and protection equipment; contingency sparing, and
14 response. Expansion at these locations is not considered a viable option.

15 In Docket No. DE 16-383, in its response to Staff 4-51, the Company provided the
16 following: Barron Avenue was initially constructed in the early 1960s. There are a
17 substantial number of asset condition and operability issues of concern at Barron Avenue.
18 Its capacity is limited by modular transformers supplied via a 23kV sub-transmission
19 system. The Salem Depot substation is somewhat older, initially constructed in the mid-
20 1950s, with similar or worse asset condition concerns, and with similar transformation

¹³ DE 16-383, Company's response to Staff 4-37.

1 and supply constraints. To varying degrees, there are asset condition, maintenance, and
2 operating issues with most groupings of equipment at both Barron Avenue and Salem
3 Depot. Simply replacing discrete pieces or groupings of equipment would not be feasible
4 due to the multiple equipment deficiencies at the substations. Maintaining, repairing, or
5 replacing the assets in their existing location and configuration, while possible, are
6 typically costly and would not be expected to yield a significant improvement in the
7 overall reliability or operability of the substation. Due to the design and overall condition
8 of the steel, foundations, bus, switches, and control houses, both substations would
9 require significant rebuild in situ. Prior experience retrofitting vintage modular or box
10 structure substations supports the notion that retrofit costs can quickly escalate.

11 Typically, such projects do not result in improved reliability or additional capacity due to
12 the supply system and/or space constraints. In the case of Barron Avenue, the substation
13 is located in a residential neighborhood and Granite State has dealt with abutter concerns
14 for decades. Salem Depot is located in a dense commercial/residential area, making
15 maintenance access and equipment replacement a significant challenge. Significant
16 expansion from Tuscan Village further complicates the approach to asset condition,
17 reliability, and capacity solutions at both sites.

18 The most apparent solution is to replace, over time, the functionality of both the Barron
19 Avenue and Salem Depot assets with modern distribution facilities from a transmission
20 system supplied substation, as close to the Salem load center as possible. The Company
21 has evaluated additional capacity from the existing Golden Rock substation and a future

1 Rockingham substation as the preferred phased alternative to rebuilding the Barron
2 Avenue and Salem Depot substations.

3 Both the Barron Avenue and Salem Depot substations are modular design substations,
4 built in the 1950s and 1960s in dense residential/small commercial locations.¹⁴ Prior
5 experience with substations of this design and vintage has revealed that rebuilding the
6 facilities with new feeder positions, including a transformer, can approach \$1M. The
7 investment is often constrained by supply system limitations stemming from conductor
8 thermal limitations, voltage, and reliability performance. Further, overall substation
9 capacity is typically capped, again limited by upstream supply limitations. Construction
10 and outage coordination also become challenging and costly. The preferred path,
11 wherever possible, is to provide new capacity from a modern design, 115/13kV
12 substation. Feeder positions typically cost less than \$500k and can usually take
13 advantage of supply and transformer capacity exceeding 60 MVA or more. They further
14 offer notable reliability and operating improvements over modular designs. Therefore,
15 given the age and condition of the Barron Avenue and Salem Depot facilities, their
16 locations, and the phased approach to utilizing 115/13kV substation capacity at Golden
17 Rock and eventually a new substation at Rockingham, we did not pursue rebuilds of the
18 Barron Avenue and Salem Depot substations beyond the preliminary discussions of
19 possible options.

¹⁴ DE 16-383, Company's response to Staff 8-84.

1 See Attachment RT-3 for a summary of equipment concerns at the Barron Ave and Salem
2 Depot substations.

3 There are a large number of equipment condition concerns at the Barron Avenue Station.
4 The 10L1 equipment ranges from 57 years in service to 31 years in service. The
5 transformer is 57 years old (as of 2006, 2 of 31 transformers of this type have failed at
6 National Grid). The 13.2 kV recloser is 45 years old; this model is known to have a
7 higher than normal failure rate. The three individual regulators are 31 years old with tap
8 change counters over 127,400, 270,000 and 197,100. Each component on this feeder is
9 approaching its end of life.

10 The 10L2 equipment ranges from 19 years in service to 16 years in service.

11 The 10L4 equipment ranges from 50 years in service to 38 years in service. The
12 transformer is 48 years old (as of 2006 - 5 of 28 transformers of this type have failed at
13 National Grid). The 13.2 kV recloser is 50 years old and is no longer supported by the
14 manufacturer, and this model is known to have a higher than normal failure rate. The
15 three individual regulators are 38 years old with tap change counters over 421,200,
16 542,500 and 559,700. Each component on this feeder is approaching its end of life.

17 There are also a large number of equipment condition concerns at the Salem Depot
18 Station. The 9L1 equipment ranges from 68 years in service to 10 years in service. The
19 transformer is 51 years old. The 13.2 kV oil circuit breaker (OCB) is 68 years old. OCBs
20 of this vintage require an above average maintenance interval. The three individual

1 regulators are 10 years old with tap change counters over 202,200, 104,900, and 107,900.

2 The transformer and OCB on this feeder are approaching their end of life.

3 The 9L2 equipment ranges from 65 years in service to 16 years in service. The 13.2 kV
4 recloser is 43 years old. The three individual regulators are 38 years old with tap change
5 counters over 98,000, 142,800 and 121,600 (this unit requires untanking to repair a failed
6 internal motor capacitor). The transformer and recloser are approaching their end of life.

7 The 9L3 equipment ranges from 47 years in service to 13 years in service. The
8 transformer is 30 years old. The H3 bushing needs replacement due to poor power factor
9 testing results. The 13.2 kV recloser is 13 years old. The individual regulators are 47
10 years old and 32 years old with tap change counters over 187,500, 217,100, and 196,800.

11 The regulators on this feeder are approaching their end of life.

12 **V. LEAST COST INTEGRATED RESOURCE PLAN (LCIRP)**

13 **Q. Does Staff address LCIRP issues being adjudicated in Docket No. DE 19-120 in its**
14 **testimony?**

15 A. Yes. The Company is unsure why Staff's testimony addresses issues in the LCIRP as
16 they are not the subject of this rate case. As Staff felt it necessary to address these issues,
17 we provide this responsive testimony.

18 **Q. What are the specific deliverables contained in Commission Order No. 26,261?**

19 A. There are two main deliverables contained in Commission Order No. 26,261 (June 4,
20 2019), which "grant[ed] Liberty Utilities a partial waiver of its 2019 Least Cost
21 Integrated Resource Plan filing requirement" in light of the "Staff Recommendation on

1 Grid Modernization ...in which Commission Staff (Staff) recommended that electric
2 distribution utilities file an ‘integrated distribution plan’ (IDP) that would be more
3 comprehensive and transparent than an LCIRP,” and which “direct[ed] the Company to
4 file a more limited document.” The first deliverable requires confirmation that the utility
5 is currently following the process of system planning using established procedures,
6 criteria, and policies outlined in its 2016 LCIRP, and achieving the objectives included its
7 2016 LCIRP. The second deliverable requires copies of adopted standard operating
8 procedures for employees and managers integrating day-to-day and long-term planning
9 consistent with the Company's objectives of Least Cost Planning.

10 **Q. Is the Company currently following the process of system planning using established**
11 **procedures, criteria and policies outlined in its 2016 LCIRP?**

12 A. Yes. The process of system planning as described in Section 4.4 of Liberty’s 2016
13 LCIRP, which includes changes to its previous criteria, are being followed. In summary
14 they include the following tasks:

- 15 • Forecast peak demand using an econometric model, which includes projected
16 customer and demand growth;
- 17 • Review and evaluate system performance using Company’s criteria and policies,
18 which includes: (a) capacity loadings for forecasted peak loads vs. ratings; (b)
19 reliability; (c) asset condition; and (d) power quality and voltage performance;
- 20 • Implement strategies for Planning Criteria, Area Strategy, and Asset Strategy;

- 1 • Identify and prioritize system deficiencies that need addressing which includes
- 2 consideration of system flexibility in response to various contingency scenarios;
- 3 • Identify wires and non-wires solutions, reflecting the guidelines for non-wires
- 4 solutions and perform evaluation of solutions;
- 5 • Decide on solutions that best meet distribution planning goals; and
- 6 • Develop proposals for system enhancement projects

7 Throughout this rate case proceeding and the ongoing LCIRP proceeding, Docket No. DE
8 19-120, Liberty has provided confirmation to Staff on the above tasks. To argue the
9 contrary, Mr. Demmer claims the Company has not satisfied the requirements of
10 Commission Order No. 26,261 due to a change in its distribution transformer rating
11 criteria,¹⁵ although the short term capital budget impact due to this change is relatively
12 minor as compared to the subtransmission line, substation transformer, and distribution
13 circuit planning criteria that were lowered in the 2016 LCIRP.¹⁶ Even though the
14 Company disagrees with this claim, Liberty has provided corrected ratings to its
15 distribution transformers as part of the LCIRP proceedings. In response to Liberty's Data
16 Request 1-27, Mr. Demmer noted the following: "In Liberty's response to Staff data
17 request 3-4 in Docket No. DE 19-120, filed on 12/19/19 (after Staff's testimony was filed
18 in Docket No. DE 19-064), the Company has corrected the distribution transformer
19 capacity criteria for three-phase padmounted transformers which would allow for a
20 higher capacity rating of the unit reducing the overall cost impact for three-phase

¹⁵ Direct Testimony of Kurt Demmer, Bates Page 11, Lines 1-4.

¹⁶ Direct Testimony of Kurt Demmer, Bates Page 10, Lines 7-9.

1 padmounts as testified in Bates 10 lines 9 through 12.” Liberty considers this issue
2 resolved and thus in compliance with the first deliverable of the LCIRP.

3 **Q. Regarding the second deliverable, has the Company provided copies of adopted**
4 **standard operating procedures for employees and managers integrating day-to-day**
5 **and long-term planning?**

6 A. Yes. As part of the 2019 filing, the Company provided construction standards,
7 distribution planning criteria, electric operating procedures, and strategy documents used
8 by employees integrating day to day and long term planning. In his testimony, Mr.
9 Demmer claims that the Company has not fulfilled this requirement as it has not provided
10 substation maintenance procedures and standards that would be necessary to evaluate
11 whether the Company has adopted standard operating procedures for employees and
12 managers¹⁷integrating day to day and long term planning. The Company explained to
13 Staff that these polices are in the process of being updated and once completed, will be
14 provided.

15 **Q. Please summarize the changes that were made to the planning criteria in 2016 and**
16 **explain the reasons for those changes.**

17 A. The 2016 changes to the planning criteria were presented to Staff in Docket No. DE 16-
18 097 and later approved by the Commission in Order No. 26,039 (July 10, 2017). They
19 were also described in the Rebuttal Testimony of Christian Brouillard, Director of
20 Engineering, in Docket No. DE 16-383, the Company’s last rate case.

¹⁷ Direct Testimony of Kurt Demmer, Bates Page 11, Lines 10-14.

1 As explained in the 2016 LCIRP proceeding, and in Mr. Brouillard's testimony in the
2 prior rate case, when Liberty Utilities acquired the Company in 2012, Liberty made a
3 commitment to its customers, communities, and the Commission to be a locally managed
4 company, responsive to the needs of our customers and to the communities in which we
5 operate. The Company also committed to invest in delivery system projects in a manner
6 consistent with this strategy. In the short run, this meant initiating and completing the
7 projects that National Grid identified, but never started. In the longer term, this
8 commitment meant developing a system design criteria that would appropriately manage
9 the day-to-day, contingency, and storm operating risks for a stand-alone utility of our
10 geographical makeup and resource base. Unlike National Grid or one of the other
11 neighboring utilities, Liberty has a limited number of crews available for response to
12 system outages and contingencies. In contrast, National Grid had an extensive resource
13 base extending from Western New York to Eastern Massachusetts, and locally,
14 significant line and substation resources available from nearby Massachusetts. Also,
15 National Grid had spare substation and overhead/underground line equipment available to
16 New Hampshire within a matter of hours. Without a significant increase to its non-in-
17 service inventory, Liberty no longer has such access to spare equipment.

18 Therefore, to meet its commitments, Liberty chose to change its system design criteria to
19 better manage its forward operating risks, and to allow for improved response and
20 flexibility to contingencies as well as to customer growth and load increases. Comparing
21 Liberty's planning criteria to that of National Grid or another nearby large utility is thus
22 unwise and inappropriate. Requiring Liberty to evaluate its system investments using

1 National Grid's planning criteria is also unreasonable and inefficient. As an example,
2 using National Grid's planning criteria, a 24-hour outage to approximately 2,000
3 customers resulting from a 23kV/13kV transformer failure would be acceptable. A sub
4 transmission (23kV) line outage impacting 4,000 customers and lasting 12 hours would
5 also be acceptable. Such planning and operating constraints are not acceptable to
6 Liberty, nor are they consistent with our aforementioned customer strategy. Although a
7 utility the size and scope of National Grid has the robust response capabilities to be able
8 to respond to such large outages, a utility of Liberty's limited size and scope simply
9 cannot respond in the same timeframe to these contingencies.

10 One can better appreciate Liberty's operating constraints and need for revised design
11 criteria by thinking of the Company as two utilities, one in the Salem area and one in
12 Lebanon. Like a smaller utility, with limited labor and material resources, Liberty's
13 reliability focus has shifted to prevention through the installation of spacer cable, and our
14 system contingency planning has shifted to one placing a greater emphasis on
15 redundancy. That is, given Liberty's reduced response capability and spare parts
16 inventory compared to what it enjoyed as a member of the National Grid family, the
17 prudent course is to focus on prevention and redundancy.

18 In the 2016 rate case proceedings, the Company validated the changes to its planning
19 criteria and the reasoning behind the changes. The criteria are entirely appropriate for a
20 utility of Liberty's size, scope, and customer commitments; reverting back to National
21 Grid's criteria is not appropriate. Nor is it appropriate or efficient to require dual

1 analyses of the projects against both National Grid and Liberty criteria as part of a cost-
2 recovery filing. After a through discussion of these issues during the hearing on the 2016
3 LCIRP, the Commission agreed with the Company and approved the new planning
4 criteria in Order No. 26,039 as part of its overall approval of the LCIRP.

5 For a summary of changes to the planning criteria, refer to the table below:

New Criteria	Previous Criteria	Reason for Change
During normal operation, all distribution feeders to remain within 75% of normal ratings.	During normal operation, all distribution feeders to remain within 100% of normal ratings.	Allows for adequate capacity on adjacent lines to restore load post-contingency and reflects Liberty's strategy to proactively plan for sufficient capacity to meet changes in demand.
During normal operation, all sub-transmission lines to remain within 90% of normal ratings.	During normal operation, all sub-transmission lines to remain within 100% of normal ratings.	Allows for adequate capacity on adjacent lines to restore load post-contingency and reflects Liberty's strategy to proactively plan for sufficient capacity to meet changes in demand.
During normal operation, all transformers to remain within 75% of normal ratings.	During normal operation, all transformers to remain within 100% of normal ratings.	Reflects Liberty's strategy to proactively plan for sufficient capacity to meet changes in demand.
For the loss of a distribution feeder, if more than 16MWhrs of load at risk results for a single feeder fault evaluate alternatives to mitigate.	No Change.	Existing targets are adequate given size of a typical Liberty distribution feeder.
For the loss of a sub-transmission supply line, the quantity of load at risk of being out of service following post contingency switching should be limited to 1.5MW combined. If more than 36MWhrs of load at risk results for a single line fault evaluate alternatives to mitigate.	For the loss of a sub-transmission supply line, the quantity of load at risk of being out of service following post contingency switching should be limited to 20MW combined. If more than 240MWhrs of load at risk results for a single line fault evaluate alternatives to mitigate.	Reflects Liberty's strategy and scale of facilities.
For the loss of a transformer, the quantity of load at risk of being out of service following post contingency switching should be limited to 2.5MW combined. If more than 60MWhrs of load at risk results for a single line fault evaluate alternatives to mitigate.	For the loss of a transformer, the quantity of load at risk of being out of service following post contingency switching should be limited to 10MW combined. If more than 240MWhrs of load at risk results for a single line fault evaluate alternatives to mitigate.	Reflects Liberty's strategy and scale of facilities.
Every effort must be made to return the failed sub-transmission line to service within 12 hours.	Every effort must be made to return the failed sub-transmission line to service within 24 hours.	Establishes a new limit for repairing feeder faults on Liberty's distribution feeders.
N/A	Every effort must be made to return the failed distribution feeder to service within 24 hours.	Establishes a new limit for repairing feeder faults on Liberty's distribution feeders.
In general, and whenever practical, each feeder should have three feeder ties to neighboring feeders.	N/A	Reflects Liberty's strategy to increase operating flexibility and support improved reliability performance due to faster service restoration times and future implementation of distribution automation.
Distribution feeders should be limited to 2,500 customers and sectionalized such that the number of customers does not exceed 500 or 2,000kVA of load between disconnecting devices.	N/A	Reflects Liberty's strategy to increase operating flexibility and support improved reliability performance due to faster service restoration times and future implementation of distribution automation.

1 **Q. Have the changes to Liberty’s Distribution Planning Criteria received regulatory**
2 **approval?**

3 A. Yes. As mentioned above, the Commission approved changes to Liberty’s Distribution
4 Planning Criteria in 2016 as part of Docket No. DE 16-097, Least Cost Integrated
5 Resource Plan. Order No. 26,039 (July 10, 2017).

6 **Q. Since the approval of the changes to Liberty’s Planning Criteria as part of its Least**
7 **Cost Integrated Resource Plan in 2016, how much has Liberty spent to date**
8 **addressing issues that can be directly attributed to a change in the planning**
9 **criteria?**

10 A. Liberty has not undertaken any projects to resolve a criteria violation that resulted from a
11 change to its planning criteria. Thus, it is irrelevant to the costs to be recovered in this
12 case whether the planning criteria should remain as approved by the Commission in 2017
13 or modified going forward. Specifically, no costs in this case were incurred to comply
14 with the heightened planning criteria approved in 2017.

15 **Q. What is Staff’s view on load at risk as it relates to transformers and supply lines?**

16 A. During the technical session held on January 14, 2020, Staff indicated that they envision
17 Unitil, Eversource, and Liberty to all have the same planning criteria and reliability
18 targets. Mr. Demmer’s testimony compared the planning criteria for the three utilities¹⁸
19 and noted that the load at risk for Unitil and Eversource is 30MW for up to 24 hours,
20 which could result in 720 MWhr of load at risk. However, Mr. Demmer did not compare

¹⁸ Direct Testimony of Kurt Demmer, Bates 13, line 1.

1 sizes of transformers that each utility typically employs in their distribution system or the
2 amount of customers served for each utility. While a criteria of 30MW/720MWhr might
3 be adequate for a utility that employs larger sized transformers and of larger scale
4 resources, it is not appropriate for Liberty's system given that all Liberty-owned
5 transformers are between 7.5MVA and 9.375MVA and supply fewer customers as
6 compared to the other utilities in New Hampshire. To understand the impact to Liberty,
7 consider a hypothetical loss of supply to the Spicket River Substation for 24 hours. The
8 Spicket River Substation roughly represents the magnitude of load at risk that Staff
9 envisions for Liberty (30 MW/720 MWhr).¹⁹ Spicket River Substation is loaded to about
10 24MW and serves 6,855 Customers. The hypothetical loss of this substation would result
11 in a loss of power to 15% of Liberty's customers and a SAIDI of 219 minutes, which is
12 more than the Company's SAIDI performance for 2018 and 2019 combined (192
13 minutes). Liberty's approved Distribution Criteria was intentionally refined from that of
14 National Grid, the former owner, to reflect the operating parameters of Liberty's smaller
15 distribution footprint and resource base. It is unlikely that the expansions of the Mount
16 Support and Pelham substations, completed by the Company within this rate period,
17 would be justifiable given a criteria that allows 30 MW of load at risk for 24 hours.

18 **VI. CONCLUSION**

19 **Q. Does this conclude your testimony?**

20 **A. Yes.**

Londonderry, NH 03053

Re: After Action Report – Winter Storm Quinn (March 7-11, 2018)

Dear Mr. Jennings:

On March 7 through 11, 2018, the impacts of Winter Storm Quinn significantly affected the Liberty Utilities electric distribution system, causing large amount of outages to the company's customers as well as similar disruption to other electricity supply providers within New Hampshire.

Puc 302.24 defines "wide-scale storms" as those affecting greater than 10% or more of a utility's customers and requiring restoration efforts lasting greater than 24 hours. Winter Storm Quinn is considered a wide-scale storm. The Commission recognizes that the March 7-11 storm was the second worst storm for Liberty Utilities in New Hampshire in terms of customer meters without power. The Commission also notes that Liberty's restoration efforts were 25% longer in duration than those of other utilities, and that the Town of Salem was the only community in New Hampshire that needed to open a shelter during the event due to the cold temperatures experienced during the extended power outage. In order to improve the Company's future restoration efforts, the Commission has determined that the completion of a self-assessment would be useful to the Commission as well as the Company. Accordingly, Liberty Utilities is directed to submit a comprehensive, written after action and self-assessment report by May 7, 2018.

At a minimum, the following information must be contained within the report:

- Number of services replaced.
- Amount of secondary wire replaced (in feet).
- Amount of primary wire (in feet, indicating size and 1ph, 2ph, 3ph, mainline).

Liberty Utilities
Request for After Action Report
April 6, 2018

- Number of transformers replaced.
- Number of poles replaced.
- Number of cross arms replaced.
- Number of environmental impact events.
- Restoration costs (indicate if finalized or estimated to date).
- The peak number of customer without power by date and time, including an hourly spreadsheet of the number of customers without power per town throughout the duration of the storm.
- Detailed discussion and timeline of executed restoration and how the order of restoration compares with the 2017 Liberty Utilities Emergency Response Plan restoration prioritization.
- Peak number of restoration crews (excluding damage assessors and tree crews) that were on the system at one time.
- A detailed discussion and associated timeline should be provided that describes the number of crews on the system prior to the storm, the number of crews planned for and needed for storm restoration efforts, all outgoing attempts to attain additional contractor or mutual aid crews, the number of crews offered by other contractors and utilities throughout the restoration event, and when crews were in New Hampshire and accepted by Liberty.
- Detailed discussion of storm event level planning prior to the storm with respect to line resource requirements, existing in-house line resource deficiencies, and external line contractors required.
- Date, time, and location of the first customer who lost power associated with the storm and the date, time, and location of the last customer who had power restored associated with the storm.
- A timeline of when and where the first-level damage assessment was initiated, entered into the OMS, and completed, including the quantity of resources utilized in the field, non-storm (day to day) roles of those field personnel assessing the damage, years of electric utility damage assessment experience; indicate which assessors had multiple roles within the Incident Command System.

Liberty Utilities
Request for After Action Report
April 6, 2018

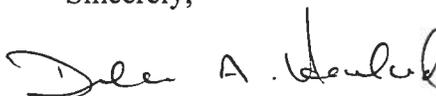

- The process followed by damage assessors and the Damage Assessor Coordinator during the Company's phase 1 assessment and any applications or equipment that were utilized to expedite the assessment of damage through the OMS, including the use of any mobile applications or other non-paper process.
- Detailed discussion, including times and duration, regarding any problems experienced with the company's OMS system, website outage map, website crew assignment, and outage reporting including attempts to repair problems during the event.
- Details of any discussions Liberty had with Town of Salem officials, such as Emergency Directors or First Responders, regarding the provision of electric power to mitigate the need for an emergency shelter to be opened.
- Detailed discussion of Liberty's attempts to facilitate restoration with National Grid of the 23kV supply line originating at Pie Hill in Methuen and providing power to the Spicket River substation.
- The Commission's understanding is that the restoration of that substation feed would significantly restore the affected circuits out of the Spicket River substation and shorten outage durations in the North Main Street and Main Street areas accordingly.
- Discussion of restoration efforts coordinated with National Grid, including switching attempts employed by Liberty to restore power within Liberty's distribution system in lieu of National Grid's prolonged restoration efforts, with associated dates and times of each step of switching.
- Discussion should include a description of the Liberty circuits involved in potential switching, significant customers on those circuits, and the date and time when power was finally restored to the Spicket River substation.
- Include any communications with National Grid and all memoranda of understanding or efforts that have been memorialized to date regarding actions with National Grid to minimize outage durations associated with future interruptions of this line.
- List the names and roles of each employee (normal positions/titles), their roles within the Incident Command System, and the number of years of their experience within the role assigned.
- Identify those employees that hold multiple roles within the Incident Command System.
- Compare and contrast the differences in preparation that Liberty undertook for the prior Northeaster (Coastal Storm "Riley") that occurred on March 2 and 3, 2018, and Winter Storm "Quinn."

Liberty Utilities
Request for After Action Report
April 6, 2018

- Include weather event indices used for both storms and note any factors that should be considered when reviewing each storm.
- Please include any other metrics normally included by Liberty within its internal self-assessments.

Please file the requested report to my attention by no later than May 7, 2018.

Sincerely,

Debra A. Howland
Executive Director

Winter Storm Quinn – March 7, 2018

Winter Storm Quinn – March 7, 2018

Winter Storm Quinn – March 7, 2018

1. Purpose

In the aftermath of the December 2008 Ice Storm, the New Hampshire Public Utilities Commission (“NHPUC”) undertook a review of utility emergency preparedness and response. The NHPUC issued its Final Report on December 3, 2009.

Appendix A to the Final Report, entitled “Action Items Checklist,” has the following going forward requirement under Item 5, “Emergency Response Actions.”

- 5.2 Each affected utility shall file self-assessments with the Commission within 60 days following any State-declared emergency event that implicates utility services. Forensic analyses of weather data should be a part of those self-assessments.

Liberty Utilities (Granite State Electric) Corp. d/b/a Liberty Utilities (“Liberty Utilities” or “the Company”) prepares this report at the request of the NHPUC Safety Division. By a voice message on March 16, 2018, the NHPUC Safety Division requested that the Company file an after action report within 60 days of the completion of restorations even though there was no State-declared emergency.

Additionally, Liberty Utilities was informed by a letter dated April 6, 2018, that an After Action Report was due on May 7, 2018. The letter stated that Winter Storm Quinn was considered a wide-scale storm. The NHPUC Safety Division did not notify the Company during the event that Winter Storm Quinn was considered a wide-scale emergency and thus the reports under Puc 307.08 were not required. However, the Company forwarded those reports to the Safety Division on its own.

2. Overview of Storm

Liberty Utilities is responsible for providing uninterrupted electric service to approximately 43,000 customers in 21 cities and towns spread out over two geographic regions known as the Lebanon and Salem areas.

The two regions generally operate as independent operations areas on opposite sides of the state with no electric system interconnections between the two regions. Each region has unique weather patterns and they operate individually during most emergencies.

Over a five day period beginning in the evening of March 7, 2018, and ending in the afternoon of March 11, 2018, Liberty Utilities experienced customer outages in both regions. The first customer outages were reported at approximately 2100 hours on Wednesday, March 11. At the peak of the storm (March 8 at 0700 hours), there were approximately 17,998 customer outages (or 41% of all customers). The majority of damage was from heavy wet snow on trees and tree limbs contacting and/or bringing down poles and wires. This event interrupted service to 20,168 customers over the five day period and impacted ten towns in Liberty Utilities’ service territory.

On average, any customer who experienced an outage during this event was out of service for 1,345 minutes (22 hours). Also, 99% of all customers interrupted were restored within 3 days of the beginning of the storm. Storm restoration was completed on Sunday, March 11 at approximately 1400 hours. Clean up from the storm and customer reconnections lasted several days after the conclusion of the storm.

The table below contains a summary of the interruptions by town.

Town	Customers Served	Customers Interrupted	% Interrupted
Atkinson	12	12	100%
Derry	119	119	100%
Pelham	5,673	5,564	98%
Salem	14,529	11,699	81%
Windham	1,169	1,152	99%
Acworth	204	204	100%
Alstead	1,105	927	84%
Langdon	283	74	26%
Marlow	7	7	100%
Walpole	2,102	4	0%

This event was the second worst event for Liberty Utilities since the NHPUC Safety Division began tracking such events.

Liberty Utilities Top Storm Events			
Event Name	December 11-24, 2008 Ice Storm	March 7-11, 2018 Quinn	Oct 29 - Nov 4, 2011 Snow Storm
# of Customers Affected	24,164	20,168	17,000
% of Customers Affected	63%	46%	41%
Duration of Restoration (hours)	168	91	108

Below is a summary of the reliability indices for this storm period.

	Events	CI	CMI	CS	SAIDI	SAIFI	CAIDI
March 7-11, 2018	153	20,168	27,132,867	44,043	616	0.46	1,345

Legend:

Event - An interruption occurring on either primary or secondary lines
CI - Customers Interrupted
CMI - Customer Minutes Interrupted
CS - Customers Served
SAIDI - System Average Interruption Duration Index
SAIFI - System Average Interruption Frequency Index
CAIDI - Customer Average Interruption Duration Index

Notes:

CMI – Customer Minutes Interrupted (Restoration time in minutes times total number of customers interrupted)

SAIDI – System Average Interruption Duration Index (Measures the total duration of an interruption for the average customer during the storm period)

SAIFI – System Average Interruption Frequency Index (The average number of times that a system customer experiences an outage during the storm period)

CAIDI – Customer Average Interruption Duration Index (Once an outage occurs the average time to restore service is found from the CAIDI)

The State of New Hampshire opened its Emergency Operating Center but did not declare an emergency event during this time period.

Under Puc 307.08 (c):

In the event that commission staff anticipates the occurrence of a wide-scale emergency, staff shall notify the utilities and the utilities shall file crew reports prior to the onset of the wide-scale emergency. Event names shall be determined by the commission and made known to each of the utilities required to report.

The NHPUC Staff did not notify the utilities of a wide-scale emergency, no wide-scale emergency was anticipated for the two Liberty Utilities regions, and no event name was designated by the NHPUC.

3. After Action Review

3.1 Pre-Storm Planning

- **Weather Forecasting**

On Monday morning, March 5, 2018, Liberty Utilities was finishing its restoration efforts from Winter Storm Riley and immediately transitioned into storm preparation for Winter Storm Quinn.

On Monday afternoon, an internal Weather Alert was issued:

SALEM/LEBANON/CHARLESTOWN, NH: Light snow becomes possible by mid to late morning on Wednesday. The steadier snows hold off until mid to late afternoon on Wednesday with moderate to heavy snows expected by Wednesday evening and into Thursday morning before winding down the rest of Thursday across the entire region. Most of this will be normal to wet snow, all wet snow into Salem and Salem also has a chance to mix with some rain later

Wednesday and Wednesday evening which could hold down snow amounts some. Currently thinking a widespread 6-12 inches is expected across most of New Hampshire with isolated higher amounts, but likely reserved for higher elevations and interior areas away from the coast/river valleys. Wind gusts of 25-35 mph will also be possible Wednesday night and into Thursday.

On Tuesday morning, March 6, 2018, a Winter Storm Warning was issued:

The National Weather Service has issued a Hazardous Weather Outlook and a Winter Storm Warning until 13:00 on Thursday 3/8/18. Telvent is predicting a Level 4 Snow event in Salem and Manchester and a Level 3 Snow event in Lebanon and Charlestown. Periods of light snow will develop between 7-10 am Wednesday. Periods of moderate/heavy snow are expected between 6 pm Wednesday until 10 am Thursday. Accumulations will range between 12-18" in Salem and Manchester and 8-14" in Lebanon and Charlestown. Snow consistency is expected to start out normal then quickly change to wet. Winds could peak around 25-35 mph Wednesday evening into Thursday morning. No ice accretion is being predicted for this storm.

Appendix A contains the Weather Sentry DTN Energy Event Index Tables for the period March 5–March 11, 2018.

Appendix B contains the Liberty Utilities Daily Weather Summaries for the period March 5–March 11, 2018.

- **Readiness Plans and Process**

Liberty Utilities followed its Electric Emergency Management Plan dated June 1, 2017. In 2016, this Plan was revised and updated to incorporate the NHPUC’s Thanksgiving Storm 2014 After Action Report Requirements.

Prior to the storm, a Type 2 Event (as defined in the Emergency Management Plan) was forecasted to commence on Tuesday, March 6, 2018. Type 2 is considered a Major Impact Event with Comprehensive Support. This event is typically characterized as having up to 200 Locations of Trouble and up to 8,400 customer outages.

The Company notified internal personnel and implemented internal storm assignments that were appropriate for a Type 2 Event.

Under Puc 306.09, Company Emergency Response Plans shall incorporate projected Event levels consistent with Table 306-1.

Table 306-1			
Utility	ERP Event Level	% Customers Out	Outage Duration (Hrs.)
	5	≤2	<12
	4	>2≤5	0-24
	3	>5 ≤10	24-48
	2	>10≤20	48-144
	1	>20	48-240

The Liberty Utilities Electric Emergency Management Plan is consistent with the Puc Rules for Electric Service.

Note that the Company Event Levels and the NHPUC Event Levels differ from the Weather Sentry Levels (shown below).

Energy Event Index Definition

No Leaves (Nov 1 - Mar 31)

EE I	Wind Speed	Wind/Gust	Snow	Ice
1	< 40 mph	< 45 mph	< 6 in.	< 1/10 in.
2	>= 40 mph	>= 45 mph	>= 6 in.	>= 1/10 in.
3	>= 50 mph	>= 55 mph	>= 8 in.	>= 3/8 in.
4	>= 60 mph	>= 70 mph	>= 12 in.	>= 1/2 in.
5	>= 70 mph	>= 85 mph	>= 24 in.	>= 1 in.

Confidence Level	
Low	<30% chance the most likely index level remains at that level through the event
Medium	30-60% chance the most likely index level remains at that level through the event
High	>=60% chance the most likely index level remains at that level through the event

*Note: Confidence is NOT a measure of probability of an event occurring; if you have an accompanying forecast discussion that information can be found there. Confidence is a measure of how likely the forecasted index level will stay at that level from now through the event, or a way to measure the potential for variability in the forecast. So for example, if it is Monday and there are level 2 gusts forecasted on Wednesday with high confidence, and if your customizable threshold for high confidence is set at 60%, it means the following: There is a >=60% chance the most likely forecasted gusts will remain at level 2 with all updates from now through Wednesday.

On Tuesday afternoon, the Company participated in NAMAG (North Atlantic Mutual Assistance Group) Call #9 for Winter Storm Riley and held its own internal Call #1 for Winter Storm Quinn. Over the next five days, the Company would participate in seven additional NAMAG calls and hold eight additional internal calls. On the sixth day, the Company began preparations for Winter Storm Skylar.

On Tuesday afternoon, March 6, 2018, the Company conducted its first internal storm call. Typically, approximately 50 – 60 employees with storm assignments are invited to participate in such calls. Attached to the meeting invitation are the following documents:

1. Meeting Agenda – Prior to Event dated March 5, 2018
2. Electric Event Organization dated March 5, 2018
3. Electric Operations Emergency Response Assignments dated March 5, 2018

These three documents are included in *Appendix E*. The Manager of Emergency Management walked through the meeting agenda.

On the initial call, the Company discussed:

- **Logistics**

Electric Operations evaluated the material levels needed for a Type 2 Event and ensured that storm kits and vehicles included the necessary items.

The hotels and pre-staging locations were identified and secured. Rental vehicles were acquired for damage assessment.

- **Crews**

Electric Operations determined the number of internal company and on-property contractor line and tree crews that were available for Liberty Utilities in each of the regions. The Company determined that it would request additional NAMAG crews. However, the Company knew that none were available at that time as a result of its participation in NAMAG calls.

- **Support Services**

The Company determined that, as a Type 2 Event, the municipal rooms, storm rooms, wires down rooms, and damage assessment rooms would open.

Also, Emergency Dispatch, Electric Control, and the Call Center brought in additional personnel to handle the anticipated additional work load.

3.2 Communication

- **Internal**

During blue sky days, as part of its daily activity, every 4 hours, Dispatch and Control sends out weather forecasts to appropriate internal personnel in New Hampshire.

During anticipated storm events, Dispatch and Control also sends out storm planning reports. Additionally, Emergency Management conducts storm planning conference calls that follow a Meeting Agenda - During Event (see *Appendix E*). There are other smaller group meetings and calls within Electric Operations and those with Storm Assignments to Electric Operations as needed.

These practices were followed starting on Tuesday, March 6 through Sunday, March 11.

Appendix C contains the Storm Planning Reports issued by Dispatch and Control. Copies were voluntarily forwarded to the NHPUC Safety Division and to nheoc@dos.nh.gov.

- **External**

While under no requirement to do so, the Company forwarded by email copies of Puc Form E-33 Distribution Crew Report to the NHPUC Safety Division. Likewise, the Company and the NHPUC Safety Division engaged in several email exchanges and phone calls during this time period.

Appendix D contains corrected copies of the Puc E-33 Forms.

The Company is not aware of any scheduled calls initiated by state government during the restoration period.

The New Hampshire Department of Safety did not issue a Declaration of Emergency. However, two press releases were issued and the NH Emergency Operations Center was opened. Also, the New Hampshire Cybersecurity Functional Exercise scheduled for March 8, 2018, was postponed.

The Company opened its Municipal Contact Center on Wednesday, March 7, at 1200 hours. The Center remained opened until Sunday, March 11 at 1900 hours. The Company communicated directly with municipal officials and first responders during this time period. Their concerns, in addition to customer outages, were the blocked roads due to tree damage and wires down.

Liberty Utilities significantly ramped up communications with customers using its social media pages (Facebook and Twitter). The Company pushed out regular general updates to all followers every 2-3 hours and attempted to respond to all customer inquiries during normal business hours. After hours, the Company reduced the individual customer responses to just emergency situations. The Company posted photos of damage so customers could see the magnitude of the damage. Liberty Utilities also utilized its website and provided updates every 3-4 hours. Customer Outage Maps were available to the public throughout the storm via the Company web-site. This was not the first time that the Company made such extensive use of social media to communicate with the public. The response by customers was positive. Customers were made aware of the Company's restoration efforts and knew that their particular situation was not being ignored.

3.3 Restoration Process

- **Resource Management**

On Monday morning, March 5, the Incident Commander began securing Company and on-property line and tree crews. Liberty Utilities had released contractor crews to work out of state to assist another utility during Winter Storm Riley. The Company requested that they return to New Hampshire by Wednesday morning ready to work.

On Tuesday morning, March 6, the Company requested ten distribution line crews and ten tree crews from the NAMAG. At that time, there were outstanding requests for approximately 1,210 distribution line crews and 22 tree crews by other NAMAG members. These outstanding requests were the result of back to back to back storms impacting the same operators in a short time period. The Company knew on Tuesday that we would not be able to pre-stage NAMAG crews.

By Wednesday evening, March 7, the Company was beginning to experience a Type 2 Event – Major Impact Event (Comprehensive Support). Such events are characterized as having up to 200 Locations of Trouble and up to 8,400 customer outages. As the Company received more information that evening, it monitored restoration efforts and dispatched the line and tree crews when and where it was safe to do so.

How and when Liberty Utilities utilized its crews is reflected in the Puc Form E-33 reports. As previously stated, these were voluntarily provided to the NHPUC Safety Division throughout the storm. An error was discovered in some reports and corrected ones are in *Appendix D*. The reports include the NAMAG crews secured on Friday, March 9.

- **Damage Assessment and Wires Down**

Electric Operations, with assistance from Gas Operations and Engineering personnel, performed all damage assessment and wires down requests. This effort began as soon as the first no power calls came in on Wednesday evening.

Additionally, the Company introduced the iRestore First Responder Smartphone App to the local fire and police departments in its electric service territories during the month of February 2018. The App enables first responders to easily send geo-tagged photos of damaged equipment directly to the Liberty Utilities. The first successful use of the App occurred during Storm Quinn. Police and Fire Dispatch Centers are still required to call Liberty Utilities Dispatch Center to report damaged equipment or emergencies. The use of the App is not limited to storms.

- **Safety**

Liberty Utilities did not experience any safety related incidents during the storm. Each morning, a written storm safety briefing was issued to all Liberty Utilities personnel with a storm assignment and to the mutual aid contractors working in the service territory.

During the five day event, there were:

- 150 employees working,
- 100 contractors working,
- 11,000 hours worked, and
- 0 safety incidents

concerning employees, contractors, customers, first responders, or the public.

4. Summary

The Settlement Agreement in Docket No. DG 06-107, approved by Order No. 24,777, requires Granite State to establish a storm reserve fund. The fund is used to pay for all of the operations and maintenance costs incurred by Granite State as the result of major storms. A major storm is defined as a severe weather event or events causing 30 concurrent troubles (i.e., interruption events occurring on either primary or secondary lines) and 15 percent of customers interrupted or 45 concurrent troubles.

The Settlement Agreement in Docket No. DE 13-063, approved by Order No. 25,738, allows Liberty Utilities to charge costs to the storm reserve if the weather forecast shows an EII Level of 3 or greater with a high probability of occurrence. The costs include pre-staging of crews, standby arrangements with external contractors, incremental compensation of employees, and other costs that may be incurred to prepare for a qualifying major storm.

There were 153 interruption events during the 91-hour period impacting 20,168 customers (or 46%). Therefore, the storm met the criteria for a major storm designation, and the costs are being charged to the storm reserve fund.

The Company has created a Storm Timeline of Events for the storm, which is contained in *Appendix G*.

Appendix *F* contains a listing of all of the customer interruptions or Events.

5. Appendices

- A. Weather Sentry DTN Energy Event Index Tables*
- B. Liberty Utilities Daily Weather Summaries*
- C. Liberty Utilities Storm Planning Reports*
- D. NH Puc E-33 Forms*
- E. Storm Call Documents*
- F. All Events*
- G. Storm Timeline of Events*

SAFETY MESSAGE

WEATHER

A. Current Weather Report

- A. Source:
- B. Time:
- C. Description:

B. Current Weather Scenarios

- A. Best Case:
- B. Worse Case:
- C. Most Likely Case:

C. Energy Event Index Forecast

- A. Event Level:
- B. Confidence Level:

Energy Event Index Definition

No Leaves (Nov 1 - Mar 31)

EEI	Wind Speed	Wind/Gust	Snow	Ice
1	< 40 mph	< 45 mph	< 6 in.	< 1/10 in.
2	>= 40 mph	>= 45 mph	>= 6 in.	>= 1/10 in.
3	>= 50 mph	>= 55 mph	>= 8 in.	>= 3/8 in.
4	>= 60 mph	>= 70 mph	>= 12 in.	>= 1/2 in.
5	>= 70 mph	>= 85 mph	>= 24 in.	>= 1 in.

Confidence Level	
Low	<30% chance the most likely EEI level remains at that level through the event
Medium	30-60% chance the most likely EEI level remains at that level through the event
High	>=60% chance the most likely EEI level remains at that level through the event

*Note: Confidence is NOT a measure of probability of an event occurring; That information can be found in the text product. Confidence is a measure of how likely the forecast EEI level will stay at that level from now through the event, or a way to measure the potential for variability in the forecast. So for example, if it is Monday and there are EEI-2 gusts forecast on Wednesday with high confidence it means the following: There is a >=60% chance the most likely forecasted gusts will remain EEI-2 with all updates from now through Wednesday.

Action Items:

SITUATION ASSESSMENT

1. Has the Director of Electric Operations declared that the Company is in Storm Preparation mode?

Yes No

A. Date:

B. Time:

2. Expected Event Type As Of Meeting Time

(Note: See Attachment 1)

A. Best Case: Choose an item.

Customers Impacted -

B. Worse Case: Choose an item.

Customers Impacted -

C. Most Likely Case: Choose an item.

Customers Impacted –

3. Expected Event Impact As Of Meeting Time

A. Impact Date: [Click here to enter a date.](#)

B. Impact Time:

C. Impact Duration:

D. Impact Location

E. Impact Description:

4. Will the Event occur during a Holiday or over a Weekend?

5. Does the NHPUC Safety Division anticipate a Wide-Scale Emergency?

Has the NHPUC notified Liberty Utilities?

Has the NHPUC named the Event per Puc 307.08 (c)?

(Note: Puc 302:24 defines "Wide-Scale Emergency" as an event that is an event which results in, or is or expected to result in:

(a) a sustained interruption of electric service to 10% or more of Liberty Utilities customers and restoration of electric service to any of these customers takes more than 24 hours; or

(b) the federal, state or local government declaring an official state of emergency in Liberty Utilities service territory and the emergency involves an interruption of electric service.)

6. Are there any Abnormal Conditions currently on the Electric Distribution System that need to be addressed before the Event?

Action Items:

RESOURCE REQUIREMENTS

Notes: A crew generally consists of two people (2 FTEs) with a truck and equipment.

Line Crews: Responsible for switching and repair of equipment and hardware and the final energizing of the line.

Digger Crews: Responsible for replacing utility poles.

Tree Crews: Responsible for removing and relocation of downed trees and limbs to eliminate safety hazards.

On Property Crews: Outside contractor crews currently working in state for Liberty Utilities at the time of the event.

Foreign Crews / Mutual Aid Crews: Outside company or contractor crews requested by LU through NAMAG.

1. Expected Company Resources Required to Restore Electric Service As Of Meeting Time

(Liberty Utilities Blue Sky staffing level is 13 crews.)

	<u>Lebanon</u>	<u>Salem</u>	<u>Charlestown</u>	<u>Londonderry</u>	<u>Total</u>
LU Line Crews					
On Property Line Crews					
Additional Contractor Line Crews					
LU Tree Crews					
Troubleshooters					
On Property Tree Crews					
Additional Contractor Tree Crews					
On Property Digger Crews					
Additional Contractor Digger Crews					
Additional Electric Controllers					
Additional Electric Dispatchers					
Additional Customer Service Representatives					

Has the Company canceled vacation for employees?

Has the Company notified employees to be on standby?

Has the LIBERTY UTILITIES – ELECTRIC OPERATIONS ON-CALL SCHEDULE been issued?

2. Expected Foreign / Mutual Aid Resources Required to Restore Electric Service As Of Meeting Time

	<u>Lebanon</u>	<u>Salem</u>	<u>Charlestown</u>	<u>Total</u>
Foreign Line Crews				
Foreign Tree Crews				
Foreign Digger Crews				

3. North Atlantic Mutual Assistance Group (NAMAG)

Has Liberty Utilities initiated a Joint Mobilization Conference Call through NAMAG? _____

Has another operator initiated a Joint Mobilization Conference Call through NAMAG? _____

What is the Liberty Utilities status at the time of the meeting?

Holding	_____	Who made the decision?	_____
Requesting	_____	Who made the decision?	_____
Offering	_____	Who made the decision?	_____

Has Liberty Utilities requested assistance from neighboring utilities? _____
(See NAMAG exception to Rules of Engagement if a single impact for a short duration.)

4. Expected Outside Contractors Required to Perform Other Services As Of Meeting Time

Service: Snowplow _____ Service: _____
Contractor: _____
Contact: _____

Service: Food _____ Service: _____
Contractor: _____
Contact: _____

Action Items:

PRE-STAGING of CREWS, PERSONNEL and MATERIALS

Has the Company considered the need to pre-stage crews?

Who made the decision?

When?

Date Pre-Staging is expected?

Time?

Action Items:

COMMUNICATIONS – Action Items

- A. To Company Employees:
 - Operations (Example: Use radio instead of cell phone.)
 - Non Operations
- B. To Governor / State Government / NH WebEOC:
- C. To NHPUC Safety Division:
- D. To Cities / Towns:
 - Are there any Storm Conference Calls scheduled:
- E. To Customers / Critical Care Customers:
- F. To Public:
- G. To NAMAG & Other Industry Groups:
- H. Other Pole Attachees:

REPORTS – Action Items

- A. Prepare internal Storm Planning Report.
- B. File Puc Form E-33 prior to the onset of any anticipated Wide-Scale Emergency.
- C. Continue to prepare and file all other required reports.

ADMINISTRATION

- A. Send all storm related information and documentation to “SM NH Storm Duty”.
- B. See CQ&EM folder on Liberty Utilities East site for Emergency Management Forms and Reports.
- C. Planning and Preparation Activities Recoverable (if EEI Level 3 or greater with a High probability)
- D. Storm/Event Accounting:

Description	GP Expense Job	GP Capital Job	GP VM Job
Storm Event EII Level			

Storm Contingency Fund (CFID 1748)

The Settlement in Docket No. DG 06-107, Exhibit GSE-7, approved by Order No. 24,777, calls for Granite State to establish a storm contingency fund. The fund would be used to pay for all of the operations and maintenance costs incurred by Granite State as the result of major storms. A major storm is defined as a severe weather event or events causing 30 concurrent troubles (i.e., interruption events occurring on either primary or secondary lines) and 15 percent of customers interrupted or 45 concurrent troubles.

The Settlement in Docket No. DE 13-063, approved in Order No. 25,738, entitles Liberty Utilities to recover certain costs if the weather forecast shows an EII Level of 3 or greater with a high probability of occurrence. The costs include pre-staging of crews, standby arrangements with external contractors, incremental compensation of employees, and other costs that may be incurred to prepare for a qualifying major storm.

INCIDENT COMMAND SYSTEM POSITIONS – Comments / Questions

1. Incident Commander:

2. On-Scene Commander / Regional Commander:

ATTACHMENT 1

The following are guidelines to determine the severity of Emergencies and their Operating Conditions for the Company.

The guidelines are intended to be consistent with Table 306-1 in NH Puc 306.09:

Emergency Response Standards and Electrical Outage Restoration

- Type 5 Small Impact Event** (*Localized Response Condition / Normal Operations*) - System activity is normal with response coordinated with local on-call personnel. Incident Command Structure not activated.
(0 - 840 customers)

- Type 4 Moderate Impact Event** (*Heightened Alert*) - The severity within a Region(s) is (are) such that restoration activities are generally accomplished within a 24 hour period. This may require assistance from another Region or contractors. Incident Command Structure may be activated at the Region level.
(840 - 2100 customers)

- Type 3 Serious Impact Event** (*Enhanced Support*) - The severity within a Region(s) is (are) such that restoration activities are generally accomplished with assistance from other Regions and contractors within 24 to 48 hour period. Incident Command structure activated at the Regional level.
(2100 - 4200 customers)

- Type 2 Major Impact Event** (*Comprehensive Support*) – The severity within the Region (s) is (are) such that restoration activities are generally accomplished with assistance from other Regions and contractors within a 48 to 144 hour period. This may require mutual assistance from other utilities. Incident Command Structure activated at the Regional level and may be activated at the System level.
(4200 - 8400 customers)

- Type 1 Catastrophic Impact Event** (*Emergency Support*) – The severity within a Region(s) is (are) such that restoration activities are accomplished with assistance from other Regions, contractors and require mutual assistance from other utilities. Restoration activities will generally require 48 to 240 hour period. The Incident Command Structure will be activated at the Regional and System levels.
(>8400 customers)

Puc 306.09 (g): Each ERP shall incorporate projected event levels consistent with Table 306-1.

Table 306-1			
Utility	ERP Event Level	% Customers Out	Outage Duration (Hrs.)
	5	≤2	<12
	4	>2≤5	0-24
	3	>5 ≤10	24-48
	2	>10≤20	48-144
	1	>20	48-240

SAFETY QUESTIONS

1. Is the Public Safe?
2. Are the Employees Safe and All Accounted For?
3. Are the Employees' Family Members Safe?

WEATHER

A. Current Weather Report

- A. Source:
- B. Time:
- C. Description:

B. Current Weather Scenarios

- A. Best Case:
- B. Worse Case:
- C. Most Likely Case:

C. Energy Event Index Forecast

- A. Event Level:
- B. Confidence Level:

Energy Event Index Definition

No Leaves (Nov 1 - Mar 31)

EEI	Wind Speed	Wind/Gust	Snow	Ice
1	< 40 mph	< 45 mph	< 6 in.	< 1/10 in.
2	>= 40 mph	>= 45 mph	>= 6 in.	>= 1/10 in.
3	>= 50 mph	>= 55 mph	>= 8 in.	>= 3/8 in.
4	>= 60 mph	>= 70 mph	>= 12 in.	>= 1/2 in.
5	>= 70 mph	>= 85 mph	>= 24 in.	>= 1 in.

Confidence Level	
Low	<30% chance the most likely EEI level remains at that level through the event
Medium	30-60% chance the most likely EEI level remains at that level through the event
High	>=60% chance the most likely EEI level remains at that level through the event

*Note: Confidence is NOT a measure of probability of an event occurring; That information can be found in the text product. Confidence is a measure of how likely the forecast EEI level will stay at that level from now through the event, or a way to measure the potential for variability in the forecast. So for example, if it is Monday and there are EEI-2 gusts forecast on Wednesday with high confidence it means the following: There is a >=60% chance the most likely forecasted gusts will remain EEI-2 with all updates from now through Wednesday.

Action Items:

SITUATION ASSESSMENT

1. Has the Incident Commander mobilized the Company resources?

Yes No

A. Date:

B. Time:

2. Event Impact As Of Meeting Time

A. Impact Location

B. Impact Description:

3. Event Type As Of Meeting Time

A. Best Case: Choose an item.

Customers Impacted -

B. Worse Case: Choose an item.

Customers Impacted -

C. Most Likely Case: Choose an item.

Customers Impacted -

4. Has the Governor declared a State of Emergency?

5. Has the State opened its Emergency Operations Center?

6. Has the NHPUC Safety Division declared a Wide-Scale Emergency?

7. Are there any known road closures on the NH WebEOC?

8. Damage Assessment Summary As Of Meeting Time

	<u>Lebanon</u>	<u>Salem</u>	<u>Charlestown</u>
Time of First Outage			
Peak Number of Customers Affected			
Peak Percent of Customers Affected			
Number of Circuits Locked Out			
Number of Feeders Affected			
Number of Substations Affected			
Number of Services To Be Replaced			
Footage of Wire To Be Reattached/Replaced			

RESOURCE DEPLOYMENT

Notes: A crew generally consists of two people (2 FTEs) with a truck and equipment.
Line Crews: Responsible for switching and repair of equipment and hardware and the final energizing of the line.
Digger Crews: Responsible for replacing utility poles.
Tree Crews: Responsible for removing and relocation of downed trees and limbs to eliminate safety hazards.
On Property Crews: Outside contractor crews currently working in state for Liberty Utilities at the time of the event.
Foreign Crews / Mutual Aid Crews: Outside company or contractor crews requested by LU through NAMAG.

1. Company Resources Required to Restore Electric Service As Of Meeting Time
(Liberty Utilities Blue Sky staffing level is 13 crews.)

- B. Prepare internal Customer Outage Reports.
- C. File Puc Forms E-33 and E-36A if a wide scale emergency.
- D. Continue to prepare and file all other required reports.

ADMINISTRATION

- A. Send all storm related information and documentation to "SM NH Storm Duty".
- B. See CQ&EM folder on Liberty Utilities East site for Emergency Management Forms and Reports.
- C. Is this a Qualifying Storm Event?
- D. Storm/Event Accounting:

Description	GP Expense Job	GP Capital Job	GP VM Job
Storm Event EII Level			

Storm Contingency Fund (CFID 1748)

The Settlement in Docket No. DG 06-107, Exhibit GSE-7, approved by Order No. 24,777, calls for Granite State to establish a storm contingency fund. The fund would be used to pay for all of the operations and maintenance costs incurred by Granite State as the result of major storms. A major storm is defined as a severe weather event or events causing 30 concurrent troubles (i.e., interruption events occurring on either primary or secondary lines) and 15 percent of customers interrupted or 45 concurrent troubles.

The Settlement in Docket No. DE 13-063, approved in Order No. 25,738, entitles Liberty Utilities to recover certain costs if the weather forecast shows an EII Level of 3 or greater with a high probability of occurrence. The costs include pre-staging of crews, standby arrangements with external contractors, incremental compensation of employees, and other costs that may be incurred to prepare for a qualifying major storm.

INCIDENT COMMAND SYSTEM POSITIONS – Comments / Questions

THIS PAGE INTENTIONALLY LEFT BLANK

Appendix G Storm Timeline

THIS PAGE INTENTIONALLY LEFT BLANK

6. NHPUC Information Requests dated April 6, 2018

6-1. ***Number of services replaced.***

Approximately 15 services were replaced as a result of Storm Quinn. These numbers may change as review of storm charges continue. There were approximately 80 services that required to be disconnected so that customer repairs could be made and later inspected. Several other services were required to be re-hung or reconnected after extensive damage from fallen trees or limbs. There were 320 reported wires down from the primary and secondary.

6-2. ***Amount of secondary wire replaced (in feet).***

Approximately 1,800 feet of secondary wire was replaced as a result of Storm Quinn.

6-3. ***Amount of primary wire (in feet, indicating size and 1 ph, 2ph, 3ph, mainline).***

Several sections of primary wire throughout the southern NH territory needed to be reconnected or re-hung due to the extensive amount of fallen trees and tree limbs in the area. Several of these sections required a minimal amount of primary wire added to splice the conductors back together. It is unknown at this time the amount of primary wire that was used for these efforts but as review of storm charges continue more details will be available. There were 320 reported wires down from the primary and secondary.

6-4. ***Number of transformers replaced.***

Two.

6-5. ***Number of poles replaced.***

Eleven.

6-6. ***Number of cross arms replaced.***

Eleven.

6-7. ***Number of environmental impact events.***

One.

6-8. ***Restoration costs (indicate if finalized or estimated to date).***

Estimated to date is \$1.15 million.

6-9. ***The peak number of customer without power by date and time, including an hourly spreadsheet of the number of customers without power per town throughout the duration of the storm.***

The peak number of customers without power was 17,998, which occurred on March 8th between the hours of 0600 and 0700. During the peak of the storm approximately 85% of the southern New Hampshire territory was without power.

This storm is the second worst storm event for Liberty since the PUC began tracking major events. Total customers impacted by Storm Quinn in the Salem Area by Town are as follows: Atkinson (100% interrupted); Salem (81% interrupted); Derry (100% interrupted); Windham (99% interrupted); and Pelham (98% interrupted). 99% of all customers interrupted were restored by March 10th at 1900 hours or about 3 days after the storm began.

6-10. Detailed discussion and timeline of executed restoration and how the order of restoration compares with the 2017 Liberty Utilities Emergency Response Plan restoration prioritization.

Outage restoration was executed in accordance with Liberty's Electric Emergency Management Plan Appendix I - Restoration of Service. The Plan reads as follows:

Emergency work is done and service is restored generally in the order of priority below:

1. Live Wires and Extreme Hazards
2. Transmission
3. Substations
4. Critical Facilities
5. Life Support Customers
6. Primary Circuits
7. Secondary Circuits
8. Final Circuit Sweep
9. Permanent Repairs
- 10.

At the recent Municipal Meetings, the Company explained the restoration steps in Quinn as follows:

1. Life Safety – Top Priority is always the life safety of the public & employees
2. Electric Infrastructure: Sub-Transmission lines/substations: Transmission Lines in New Hampshire supplying Liberty Utility Substations are owned by National Grid.
3. Utility Defined Critical Facilities: Hospitals, police/fire stations, water supply, sewage treatment facilities (identified by Municipal Officials)
4. Circuit Backbones: Main line distribution circuits which feed lateral lines
5. Lateral Feeders: Large blocks of customers and/or whole neighborhoods, largest number of customers in the minimum amount of time
6. Transformers/Secondary Circuits
7. Individual House Services

6-11. Peak number of restoration crews (excluding damage assessors and tree crews) that were on the system at one time.

Liberty Utilities had:

- 9 Company restoration crews

- 8 on-property contractor crews
- 15 NAMAG crews

Contractor crews worked during day-time hours.
Company crews were split between day-time and night-time to provide 24 hour coverage.

6-12. A detailed discussion and associated timeline should be provided that describes the number of crews on the system prior to the storm, the number of crews planned for and needed for storm restoration efforts, all outgoing attempts to attain additional contractor or mutual aid crews, the number of crews offered by other contractors and utilities throughout the restoration event, and when crews were in New Hampshire and accepted by Liberty.

On Monday morning, the Incident Commander began securing Company and on-property contractor crews. Liberty Utilities had released contractor crews to assist a utility in another state during Winter Storm Riley. Liberty Utilities requested that they be returned ready to work by Wednesday morning. On Tuesday morning, the Company requested 10 line crews and 10 tree crews through NAMAG. However, none were available. On Tuesday afternoon, the Company informed the NHPUC Safety Division. On Thursday morning, the NHPUC Safety Division informed the Company that there were Canadian crews available from the NHEC. The Company contacted NHEC and NAMAG, but could not confirm this. On Thursday afternoon, the Company secured line crews from Evansville, Indiana, and Madison, Wisconsin, and tree crews from National Grid. A short time later, the Company secured crews from Vermont and canceled the Indiana and Wisconsin crews once we learned they were tree crews only. On Friday morning, the Company secured line crews from PSNH, Unitil, and NHEC. Initially, the Company turned down the Unitil and NHEC crews but reconsidered within the hour after the supervision, field coordination, and safety concerns were resolved. The Company informed the NHPUC Safety Division. The crew counts were provided in the filed reports. As it turned out, the crews provided by Unitil were the Canadian crews.

6-13. Detailed discussion of storm event level planning prior to the storm with respect to line resource requirements, existing in-house line resource deficiencies, and external line contractors required.

As with all potential electric events, before the initial call with the 60 invitees, there is a smaller call with Senior Management and Electric Operations. Appendix H of the Electric Emergency Plan contains a 3 Day Checklist. Items are discussed as necessary.

This smaller call or in-person meeting is generally held at the earliest notice of pending inclement weather. Because of the back to back to back storms Riley, Quinn, and Skylar, there were multiple opportunities to discuss available resources from an offering, holding, and requesting point of view.

6-14. Date, time, and location of the first customer who lost power associated with the storm and the date, time, and location of the last customer who had power restored associated with the storm.

First customers to lose power as a result of Storm Quinn occurred at 2141 hours on March 7 in the Zion Hill Area of Salem. The last customer to be restored occurred on March 11 at 1400 hours in the Castle Hill Rd Area of Windham.

6-15. A timeline of when and where the first-level damage assessment was initiated, entered into the OMS, and completed, including the quantity of resources utilized in the field, non-storm (day to day) roles of those field personnel assessing the damage, years of electric utility damage assessment experience; indicate which assessors had multiple roles within the Incident Command System.

Electric Operations personnel began damage assessment as soon as the first customers began to lose power on Wednesday evening. Those personnel with storm assignments in damage assessment began working early on Thursday morning. Both groups continued until Sunday morning.

The Damage Assessment responsibilities and procedures are detailed in Appendix J of the Electric Emergency Plan. Those personnel assigned to Damage Assessment can be found in the documents contained in *Appendix E* of this report.

6-16. The process followed by damage assessors and the Damage Assessor Coordinator during the Company's phase 1 assessment and any applications or equipment that were utilized to expedite the assessment of damage through the OMS, including the use of any mobile applications or other non-paper process.

The damage assessors followed the procedures detailed in Appendix J of the Electric Emergency Plan.

6-17. Detailed discussion, including times and duration, regarding any problems experienced with the company's OMS system, website outage map, website crew assignment, and outage reporting including attempts to repair problems during the event.

Initially, the amount of incoming customer calls caused the OMS system to predict upstream devices from actual affected devices. This resulted in higher predicted interruptions being reported in the website outage map. After updating the prediction mode in the system, Liberty was able to correct these reported amounts and the management of incidents in the OMS system improved.

During the latter stage of the storm some incidents had to be re-created to reflect accurate customer counts in the system. This caused the customer counts to increase temporarily in the outage map as these incidents were recreated and managed through completion. This issue took several hours to correct.

The outage management system had issues with reporting hazards (wires down; tree/limbs) due to an unknown bug in the system with unknown regions. This caused the wires down to be managed and tracked manually by the wires down team. This issue has since been resolved

6-18. *Details of any discussions Liberty had with Town of Salem officials, such as Emergency Directors or First Responders, regarding the provision of electric power to mitigate the need for an emergency shelter to be opened.*

Liberty Utilities opened its Municipal Contact Center on March 7 at noon. Fire Chief/EMD Paul Parisi and Assistant Chief Lawrence Best came to the Company's office twice a day throughout the restoration to discuss road closures and public safety.

On March 8, the Company reviewed the priority customers that had no power, as well as neighborhoods without power, and the estimated restoration times. Areas that were able to be restored through switching were identified, as were areas that would remain out overnight. Due to the large amount of outages in Salem and the estimated restoration times, the Town officials decided to open a shelter at the Ingram Senior Center on March 8 at 7 p.m. The Company kept the Town officials abreast of the areas that were restored on an ongoing basis.

The Company received 113 Priority 2 (Hindering Emergency Operations) calls during the Storm. Included were 14 "Wires Down" alerts through the iRestore App, which were submitted via local Fire and Police Personnel. During restoration of the storm, Liberty Utilities met regularly and worked closely with different chiefs of emergency personnel from different towns to discuss road closures and prioritization of restorations.

Note that on March 29, 2018, the Company hosted its annual Municipal Meetings as required by NH Puc 306.09. One agenda item was how the Company restores power to customers after a storm. The Company validated the Town of Salem's critical infrastructure listing. The NHPUC Safety Division declined the Company's invitation to attend so the Company forwarded a copy of the presentation to the Safety Division after the meeting.

6-19. *Detailed discussion of Liberty's attempts to facilitate restoration with National Grid of the 23kV supply line originating at Pie Hill in Methuen and providing power to the Spicket River substation.*

The loss of the National Grid 23kV-2376 Supply Line to Spicket River occurred on March 8 at approximately 3:50 a.m. Initially, National Grid indicated that the loss of supply was due to issues with the 115kV source at their Ward Hill substation. Liberty was not aware there was another issue, trees on primary, on the 23 kV Supply line until the morning of March 9 when a helicopter patrol was performed. Liberty immediately dispatched tree crews to address this issue. Liberty had performed a foot patrol of a portion of the 23 kV right of way and no tree hazards were identified at the time.

Throughout the duration of this outage, both Liberty Storm Room personnel and Liberty Control Room personnel were in contact, via phone, with National Grid regarding expected restoration of supply lines. Liberty Control Room personnel contacted both National Grid's Distribution and Transmission Control Rooms requesting updates. Liberty Storm Room Personnel contacted National Grid's Transmission Account Management Team regarding this outage and expected restoration.

6-20. *The Commission's understanding is that the restoration of that substation feed would significantly restore the affected circuits out of the Spicket River substation and shorten outage durations in the North Main Street and Main Street areas accordingly.*

The Commission is correct.

6-21. *Discussion of restoration efforts coordinated with National Grid, including switching attempts employed by Liberty to restore power within Liberty's distribution system in lieu of National Grid's prolonged restoration efforts, with associated dates and times of each step of switching.*

On March 8 at approximately 11:30 a.m., a portion of the 13L2 feeder was restored via the Salem Depot 9L3 feeder. On March 8 at approximately 4 p.m., the Spicket River 13L3 feeder was restored via the Olde Trolley 18L2 feeder. Restorations of the Spicket River feeders were delayed due to multiple lockouts in the adjacent areas which also prevented further restorations of these feeders.

6-22. *Discussion should include a description of the Liberty circuits involved in potential switching, significant customers on those circuits, and the date and time when power was finally restored to the Spicket River substation.*

See the response to Number 21 for a portion of this response. The 2376 Supply Line was restored on March 9 at approximately 2 p.m.

6-23. *Include any communications with National Grid and all memoranda of understanding or efforts that have been memorialized to date regarding actions with National Grid to minimize outage durations associated with future interruptions of this line.*

There are no known communications or memoranda.

6-24. *List the names and roles of each employee (normal positions/titles), their roles within the Incident Command System, and the number of years of their experience within the role assigned.*

The employees with roles within the ICS as of March 5, 2018, are listed on the documents in *Appendix E*. These documents are updated after each Event. The start and end dates of the assignments are not tracked. Day One for Liberty Utilities was July 3, 2012. Therefore, everyone on the list has less than six years' experience in their assignment as Liberty Utilities personnel. Some however bring experience from other utilities.

Additionally, there has been some turnover in the ICS assignments due to some individuals not meeting the Company expectations.

Nonetheless, as a result of drills, tabletop exercises, and actual events over the past six years, all assigned employees have an understanding of their roles.

See the table below:

	Drills	Table Top Exercises	Municipal Meetings	Actual Events
2018			March 28 – Lebanon March 29 - Salem	Jan 3-4: Snow (Grayson) Feb 6-7: Snow (Liam) Mar 2-3: Wind (Riley) Mar 7-11: Snow (Quinn) Mar 13-14: Snow (Skylar) Mar 20-22: Snow (Toby) Apr 4-5: Snow (Wilbur)
2017	August 30		April 11 - Concord	Jan 23-24: Wind/Snow Feb 8-9: Snow Feb 10-12: Snow (Orson) March 13-15: Snow (Stella) March 30-April 1: Snow June 19: Thunderstorm Oct 30-31: Wind Dec 24-25: Ice
2016	May 24 (NAMAG) Aug 17 (NAMAG)	November 28 March 31 (NGRID-Transmission)	April 5 – Salem April 12 - Lebanon	January 20: Wind/Snow February 4-5: Snow February 15: Snow March 19: Wind/Snow April 3: Wind/Snow Sept 9: Wind/Rain October 6: Hurricane (Matthew) December 28-29: Snow
2015	December 9	December 15	March 27 - Lebanon March 30 - Londonderry	January 2-4: Ice/Snow January 26-27: Ice/Snow February 1-2: Ice/Snow February 13-15: Ice/Snow February 21-22: Ice/Snow October 2: Hurricane December 28-29: Ice/Snow
2014		July 23	March 4 - Lebanon March 5 - Salem	December 8-10: Ice/Snow November 23-28: Ice/Snow
2013			January 29 - Lebanon January 31 - Salem	February 8-10: Blizzard (Nemo)
2012	July 30			October 29-31: Hurricane Sandy

6-25. Identify those employees that hold multiple roles within the Incident Command System.

As shown on the documents in *Appendix E*, most ICS Positions have a Primary, Secondary, and Backup. In some limited situations, a Primary in one position may act as a Backup in another position. For example, once an individual completes their Onboarding Assignment, they may be able to act as a Field Guide.

6-26. Compare and contrast the differences in preparation that Liberty undertook for the prior Northeaster (Coastal Storm "Riley") that occurred on March 2 and 3, 2018, and Winter Storm "Quinn."

As shown in the table below, the storms were not comparable.

Nonetheless, the Company conducted its initial internal storm preparation call and followed the three documents similar to those in *Appendix E*. Once the storm's impact was known, the remaining calls were canceled.

Subject	Riley	Quinn
Dates	March 2 - 3	March 5 - 11
Weather Forecast	Hazardous Weather Outlook	Winter Storm Warning
Type Event	4	2
Planning Reports Issued	1	11
Internal Storm Calls	1	9
NAMAG Storm Calls	3	9

6-27. Include weather event indices used for both storms and note any factors that should be considered when reviewing each storm.

See the above table. From the National Weather Service:

Hazardous Weather Outlook

The Hazardous Weather Outlook will describe potential hazardous weather and hydrologic information of concern in Days 1 through 7.

The outlook contains two segments: One segment for the marine zones and adjacent land-based (i.e., coastal) zones and the other segment for the rest of the land-based zones. Each segment of the HWO will contain 3 sections: short term through Day 1, long term for Days 2-7, and spotter information.

Winter Storm Watch

A Winter Storm Watch is issued when there is the potential for significant and hazardous winter weather within 48 hours. It does not mean that significant and hazardous winter weather will occur...it only means it is possible.

Significant and hazardous winter weather is defined as a combination of:

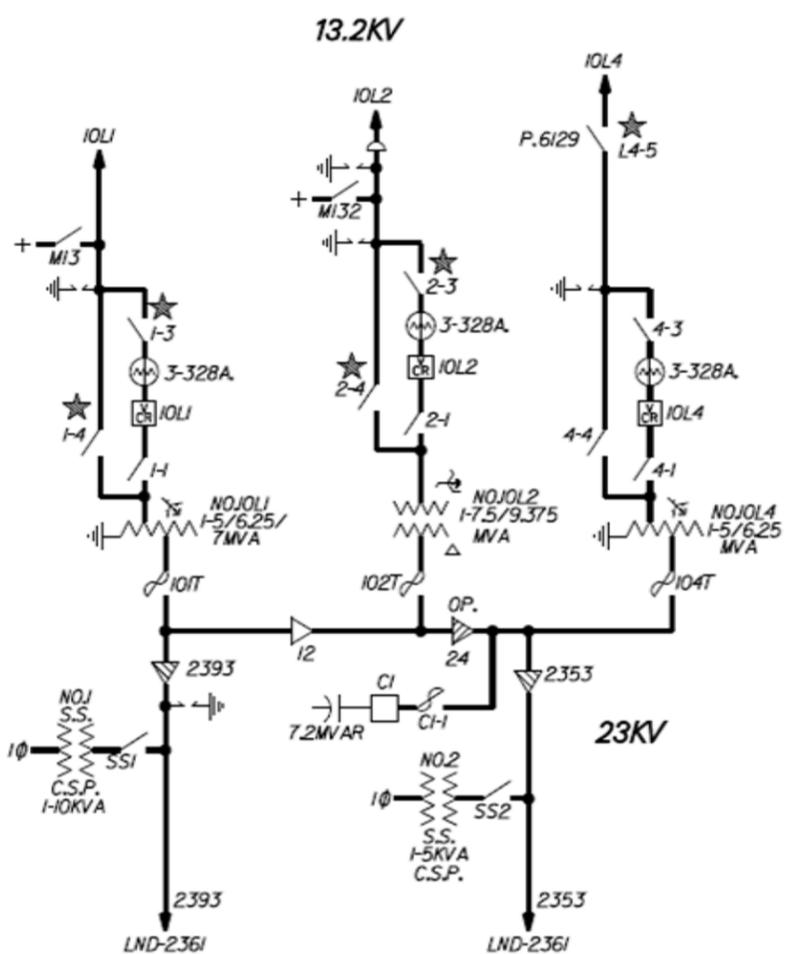

- 1) 5 inches or more of snow/sleet within a 12-hour period **or** 7 inches or more of snow/sleet within a 24-hour period
AND/OR
- 2) Enough ice accumulation to cause damage to trees or powerlines.
AND/OR
- 3) a life threatening or damaging combination of snow and/or ice accumulation with wind.

The snow/sleet criteria for a Winter Storm Watch for the five westernmost counties (Allegany, Mineral, Grant, Pendleton, and Highland) is higher (6 inches or more within a 12-hour period; 8 inches or more within a 24-hour period).

6-28. Please include any other metrics normally included by Liberty within its internal self-assessments.

See Section 2 Overview of Storm.

Barron Ave Station - No 10 - OnLine

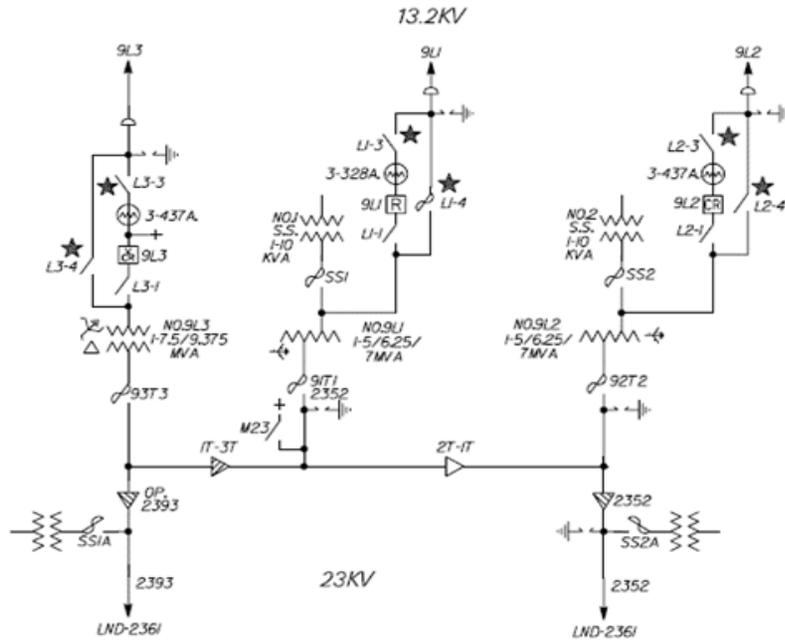

Major Equipment	Average Station Equipment Age 2019
23-13.2 kV Transformer	41
13.2 kv Recloser/Breaker	37
Regulator - Phase A	29

Exhibit 32
THE STATE OF NEW HAMPSHIRE

PUBLIC UTILITIES COMMISSION

21 S. Fruit Street, Suite 10

Concord, N.H. 03301-2429

CHAIRMAN
Martin P. Honigberg

COMMISSIONERS
Kathryn M. Bailey
Michael S. Giaimo

EXECUTIVE DIRECTOR
Debra A. Howland

April 6, 2018

Craig Jennings
Vice President of Operations and Engineering
Liberty Utilities
15 Buttrick Road
Londonderry, NH 03053

Re: After Action Report – Winter Storm Quinn (March 7-11, 2018)

Dear Mr. Jennings:

On March 7 through 11, 2018, the impacts of Winter Storm Quinn significantly affected the Liberty Utilities electric distribution system, causing large amount of outages to the company's customers as well as similar disruption to other electricity supply providers within New Hampshire.

Puc 302.24 defines "wide-scale storms" as those affecting greater than 10% or more of a utility's customers and requiring restoration efforts lasting greater than 24 hours. Winter Storm Quinn is considered a wide-scale storm. The Commission recognizes that the March 7-11 storm was the second worst storm for Liberty Utilities in New Hampshire in terms of customer meters without power. The Commission also notes that Liberty's restoration efforts were 25% longer in duration than those of other utilities, and that the Town of Salem was the only community in New Hampshire that needed to open a shelter during the event due to the cold temperatures experienced during the extended power outage. In order to improve the Company's future restoration efforts, the Commission has determined that the completion of a self-assessment would be useful to the Commission as well as the Company. Accordingly, Liberty Utilities is directed to submit a comprehensive, written after action and self-assessment report by May 7, 2018.

At a minimum, the following information must be contained within the report:

- Number of services replaced.
- Amount of secondary wire replaced (in feet).
- Amount of primary wire (in feet, indicating size and 1ph, 2ph, 3ph, mainline).

Liberty Utilities
Request for After Action Report
April 6, 2018

- Number of transformers replaced.
- Number of poles replaced.
- Number of cross arms replaced.
- Number of environmental impact events.
- Restoration costs (indicate if finalized or estimated to date).
- The peak number of customer without power by date and time, including an hourly spreadsheet of the number of customers without power per town throughout the duration of the storm.
- Detailed discussion and timeline of executed restoration and how the order of restoration compares with the 2017 Liberty Utilities Emergency Response Plan restoration prioritization.
- Peak number of restoration crews (excluding damage assessors and tree crews) that were on the system at one time.
- A detailed discussion and associated timeline should be provided that describes the number of crews on the system prior to the storm, the number of crews planned for and needed for storm restoration efforts, all outgoing attempts to attain additional contractor or mutual aid crews, the number of crews offered by other contractors and utilities throughout the restoration event, and when crews were in New Hampshire and accepted by Liberty.
- Detailed discussion of storm event level planning prior to the storm with respect to line resource requirements, existing in-house line resource deficiencies, and external line contractors required.
- Date, time, and location of the first customer who lost power associated with the storm and the date, time, and location of the last customer who had power restored associated with the storm.
- A timeline of when and where the first-level damage assessment was initiated, entered into the OMS, and completed, including the quantity of resources utilized in the field, non-storm (day to day) roles of those field personnel assessing the damage, years of electric utility damage assessment experience; indicate which assessors had multiple roles within the Incident Command System.

Liberty Utilities
Request for After Action Report
April 6, 2018

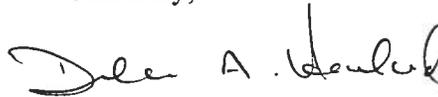

- The process followed by damage assessors and the Damage Assessor Coordinator during the Company's phase 1 assessment and any applications or equipment that were utilized to expedite the assessment of damage through the OMS, including the use of any mobile applications or other non-paper process.
- Detailed discussion, including times and duration, regarding any problems experienced with the company's OMS system, website outage map, website crew assignment, and outage reporting including attempts to repair problems during the event.
- Details of any discussions Liberty had with Town of Salem officials, such as Emergency Directors or First Responders, regarding the provision of electric power to mitigate the need for an emergency shelter to be opened.
- Detailed discussion of Liberty's attempts to facilitate restoration with National Grid of the 23kV supply line originating at Pie Hill in Methuen and providing power to the Spicket River substation.
- The Commission's understanding is that the restoration of that substation feed would significantly restore the affected circuits out of the Spicket River substation and shorten outage durations in the North Main Street and Main Street areas accordingly.
- Discussion of restoration efforts coordinated with National Grid, including switching attempts employed by Liberty to restore power within Liberty's distribution system in lieu of National Grid's prolonged restoration efforts, with associated dates and times of each step of switching.
- Discussion should include a description of the Liberty circuits involved in potential switching, significant customers on those circuits, and the date and time when power was finally restored to the Spicket River substation.
- Include any communications with National Grid and all memoranda of understanding or efforts that have been memorialized to date regarding actions with National Grid to minimize outage durations associated with future interruptions of this line.
- List the names and roles of each employee (normal positions/titles), their roles within the Incident Command System, and the number of years of their experience within the role assigned.
- Identify those employees that hold multiple roles within the Incident Command System.
- Compare and contrast the differences in preparation that Liberty undertook for the prior Northeaster (Coastal Storm "Riley") that occurred on March 2 and 3, 2018, and Winter Storm "Quinn."

Liberty Utilities
Request for After Action Report
April 6, 2018

- Include weather event indices used for both storms and note any factors that should be considered when reviewing each storm.
- Please include any other metrics normally included by Liberty within its internal self-assessments.

Please file the requested report to my attention by no later than May 7, 2018.

Sincerely,

Debra A. Howland
Executive Director

**Winter Storm Quinn – March 2018
After Action Report for Liberty Utilities**

Winter Storm Quinn – March 7, 2018

Winter Storm Quinn – March 7, 2018

Winter Storm Quinn – March 7, 2018

1. Purpose

In the aftermath of the December 2008 Ice Storm, the New Hampshire Public Utilities Commission (“NHPUC”) undertook a review of utility emergency preparedness and response. The NHPUC issued its Final Report on December 3, 2009.

Appendix A to the Final Report, entitled “Action Items Checklist,” has the following going forward requirement under Item 5, “Emergency Response Actions.”

- 5.2 Each affected utility shall file self-assessments with the Commission within 60 days following any State-declared emergency event that implicates utility services. Forensic analyses of weather data should be a part of those self-assessments.

Liberty Utilities (Granite State Electric) Corp. d/b/a Liberty Utilities (“Liberty Utilities” or “the Company”) prepares this report at the request of the NHPUC Safety Division. By a voice message on March 16, 2018, the NHPUC Safety Division requested that the Company file an after action report within 60 days of the completion of restorations even though there was no State-declared emergency.

Additionally, Liberty Utilities was informed by a letter dated April 6, 2018, that an After Action Report was due on May 7, 2018. The letter stated that Winter Storm Quinn was considered a wide-scale storm. The NHPUC Safety Division did not notify the Company during the event that Winter Storm Quinn was considered a wide-scale emergency and thus the reports under Puc 307.08 were not required. However, the Company forwarded those reports to the Safety Division on its own.

2. Overview of Storm

Liberty Utilities is responsible for providing uninterrupted electric service to approximately 43,000 customers in 21 cities and towns spread out over two geographic regions known as the Lebanon and Salem areas.

The two regions generally operate as independent operations areas on opposite sides of the state with no electric system interconnections between the two regions. Each region has unique weather patterns and they operate individually during most emergencies.

Over a five day period beginning in the evening of March 7, 2018, and ending in the afternoon of March 11, 2018, Liberty Utilities experienced customer outages in both regions. The first customer outages were reported at approximately 2100 hours on Wednesday, March 11. At the peak of the storm (March 8 at 0700 hours), there were approximately 17,998 customer outages (or 41% of all customers). The majority of damage was from heavy wet snow on trees and tree limbs contacting and/or bringing down poles and wires. This event interrupted service to 20,168 customers over the five day period and impacted ten towns in Liberty Utilities’ service territory.

On average, any customer who experienced an outage during this event was out of service for 1,345 minutes (22 hours). Also, 99% of all customers interrupted were restored within 3 days of the beginning of the storm. Storm restoration was completed on Sunday, March 11 at approximately 1400 hours. Clean up from the storm and customer reconnections lasted several days after the conclusion of the storm.

The table below contains a summary of the interruptions by town.

Town	Customers Served	Customers Interrupted	% Interrupted
Atkinson	12	12	100%
Derry	119	119	100%
Pelham	5,673	5,564	98%
Salem	14,529	11,699	81%
Windham	1,169	1,152	99%
Acworth	204	204	100%
Alstead	1,105	927	84%
Langdon	283	74	26%
Marlow	7	7	100%
Walpole	2,102	4	0%

This event was the second worst event for Liberty Utilities since the NHPUC Safety Division began tracking such events.

Liberty Utilities Top Storm Events			
Event Name	December 11-24, 2008 Ice Storm	March 7-11, 2018 Quinn	Oct 29 - Nov 4, 2011 Snow Storm
# of Customers Affected	24,164	20,168	17,000
% of Customers Affected	63%	46%	41%
Duration of Restoration (hours)	168	91	108

Below is a summary of the reliability indices for this storm period.

	Events	CI	CMI	CS	SAIDI	SAIFI	CAIDI
March 7-11, 2018	153	20,168	27,132,867	44,043	616	0.46	1,345

Legend:

Event - An interruption occurring on either primary or secondary lines
CI - Customers Interrupted
CMI - Customer Minutes Interrupted
CS - Customers Served
SAIDI - System Average Interruption Duration Index
SAIFI - System Average Interruption Frequency Index
CAIDI - Customer Average Interruption Duration Index

Notes:

CMI – Customer Minutes Interrupted (Restoration time in minutes times total number of customers interrupted)
SAIDI – System Average Interruption Duration Index (Measures the total duration of an interruption for the average customer during the storm period)
SAIFI – System Average Interruption Frequency Index (The average number of times that a system customer experiences an outage during the storm period)
CAIDI – Customer Average Interruption Duration Index (Once an outage occurs the average time to restore service is found from the CAIDI)

The State of New Hampshire opened its Emergency Operating Center but did not declare an emergency event during this time period.

Under Puc 307.08 (c):

In the event that commission staff anticipates the occurrence of a wide-scale emergency, staff shall notify the utilities and the utilities shall file crew reports prior to the onset of the wide-scale emergency. Event names shall be determined by the commission and made known to each of the utilities required to report.

The NHPUC Staff did not notify the utilities of a wide-scale emergency, no wide-scale emergency was anticipated for the two Liberty Utilities regions, and no event name was designated by the NHPUC.

3. After Action Review

3.1 Pre-Storm Planning

- **Weather Forecasting**

On Monday morning, March 5, 2018, Liberty Utilities was finishing its restoration efforts from Winter Storm Riley and immediately transitioned into storm preparation for Winter Storm Quinn.

On Monday afternoon, an internal Weather Alert was issued:

SALEM/LEBANON/CHARLESTOWN, NH: Light snow becomes possible by mid to late morning on Wednesday. The steadier snows hold off until mid to late afternoon on Wednesday with moderate to heavy snows expected by Wednesday evening and into Thursday morning before winding down the rest of Thursday across the entire region. Most of this will be normal to wet snow, all wet snow into Salem and Salem also has a chance to mix with some rain later

Wednesday and Wednesday evening which could hold down snow amounts some. Currently thinking a widespread 6-12 inches is expected across most of New Hampshire with isolated higher amounts, but likely reserved for higher elevations and interior areas away from the coast/river valleys. Wind gusts of 25-35 mph will also be possible Wednesday night and into Thursday.

On Tuesday morning, March 6, 2018, a Winter Storm Warning was issued:

The National Weather Service has issued a Hazardous Weather Outlook and a Winter Storm Warning until 13:00 on Thursday 3/8/18. Telvent is predicting a Level 4 Snow event in Salem and Manchester and a Level 3 Snow event in Lebanon and Charlestown. Periods of light snow will develop between 7-10 am Wednesday. Periods of moderate/heavy snow are expected between 6 pm Wednesday until 10 am Thursday. Accumulations will range between 12-18" in Salem and Manchester and 8-14" in Lebanon and Charlestown. Snow consistency is expected to start out normal then quickly change to wet. Winds could peak around 25-35 mph Wednesday evening into Thursday morning. No ice accretion is being predicted for this storm.

Appendix A contains the Weather Sentry DTN Energy Event Index Tables for the period March 5–March 11, 2018.

Appendix B contains the Liberty Utilities Daily Weather Summaries for the period March 5–March 11, 2018.

- **Readiness Plans and Process**

Liberty Utilities followed its Electric Emergency Management Plan dated June 1, 2017. In 2016, this Plan was revised and updated to incorporate the NHPUC's Thanksgiving Storm 2014 After Action Report Requirements.

Prior to the storm, a Type 2 Event (as defined in the Emergency Management Plan) was forecasted to commence on Tuesday, March 6, 2018. Type 2 is considered a Major Impact Event with Comprehensive Support. This event is typically characterized as having up to 200 Locations of Trouble and up to 8,400 customer outages.

The Company notified internal personnel and implemented internal storm assignments that were appropriate for a Type 2 Event.

Under Puc 306.09, Company Emergency Response Plans shall incorporate projected Event levels consistent with Table 306-1.

Table 306-1			
Utility	ERP Event Level	% Customers Out	Outage Duration (Hrs.)
	5	≤2	<12
	4	>2≤5	0-24
	3	>5 ≤10	24-48
	2	>10≤20	48-144
	1	>20	48-240

The Liberty Utilities Electric Emergency Management Plan is consistent with the Puc Rules for Electric Service.

Note that the Company Event Levels and the NHPUC Event Levels differ from the Weather Sentry Levels (shown below).

Energy Event Index Definition

No Leaves (Nov 1 - Mar 31)

EE I	Wind Speed	Wind/Gust	Snow	Ice
1	< 40 mph	< 45 mph	< 6 in.	< 1/10 in.
2	>= 40 mph	>= 45 mph	>= 6 in.	>= 1/10 in.
3	>= 50 mph	>= 55 mph	>= 8 in.	>= 3/8 in.
4	>= 60 mph	>= 70 mph	>= 12 in.	>= 1/2 in.
5	>= 70 mph	>= 85 mph	>= 24 in.	>= 1 in.

Confidence Level	
Low	<30% chance the most likely index level remains at that level through the event
Medium	30-60% chance the most likely index level remains at that level through the event
High	>=60% chance the most likely index level remains at that level through the event

*Note: Confidence is NOT a measure of probability of an event occurring; if you have an accompanying forecast discussion that information can be found there. Confidence is a measure of how likely the forecasted index level will stay at that level from now through the event, or a way to measure the potential for variability in the forecast. So for example, if it is Monday and there are level 2 gusts forecasted on Wednesday with high confidence, and if your customizable threshold for high confidence is set at 60%, it means the following: There is a >=60% chance the most likely forecasted gusts will remain at level 2 with all updates from now through Wednesday.

On Tuesday afternoon, the Company participated in NAMAG (North Atlantic Mutual Assistance Group) Call #9 for Winter Storm Riley and held its own internal Call #1 for Winter Storm Quinn. Over the next five days, the Company would participate in seven additional NAMAG calls and hold eight additional internal calls. On the sixth day, the Company began preparations for Winter Storm Skylar.

On Tuesday afternoon, March 6, 2018, the Company conducted its first internal storm call. Typically, approximately 50 – 60 employees with storm assignments are invited to participate in such calls. Attached to the meeting invitation are the following documents:

1. Meeting Agenda – Prior to Event dated March 5, 2018
2. Electric Event Organization dated March 5, 2018
3. Electric Operations Emergency Response Assignments dated March 5, 2018

These three documents are included in *Appendix E*. The Manager of Emergency Management walked through the meeting agenda.

On the initial call, the Company discussed:

- **Logistics**

Electric Operations evaluated the material levels needed for a Type 2 Event and ensured that storm kits and vehicles included the necessary items.

The hotels and pre-staging locations were identified and secured. Rental vehicles were acquired for damage assessment.

- **Crews**

Electric Operations determined the number of internal company and on-property contractor line and tree crews that were available for Liberty Utilities in each of the regions. The Company determined that it would request additional NAMAG crews. However, the Company knew that none were available at that time as a result of its participation in NAMAG calls.

- **Support Services**

The Company determined that, as a Type 2 Event, the municipal rooms, storm rooms, wires down rooms, and damage assessment rooms would open.

Also, Emergency Dispatch, Electric Control, and the Call Center brought in additional personnel to handle the anticipated additional work load.

3.2 Communication

- **Internal**

During blue sky days, as part of its daily activity, every 4 hours, Dispatch and Control sends out weather forecasts to appropriate internal personnel in New Hampshire.

During anticipated storm events, Dispatch and Control also sends out storm planning reports. Additionally, Emergency Management conducts storm planning conference calls that follow a Meeting Agenda - During Event (see *Appendix E*). There are other smaller group meetings and calls within Electric Operations and those with Storm Assignments to Electric Operations as needed.

These practices were followed starting on Tuesday, March 6 through Sunday, March 11.

Appendix C contains the Storm Planning Reports issued by Dispatch and Control. Copies were voluntarily forwarded to the NHPUC Safety Division and to nheoc@dos.nh.gov.

- **External**

While under no requirement to do so, the Company forwarded by email copies of Puc Form E-33 Distribution Crew Report to the NHPUC Safety Division. Likewise, the Company and the NHPUC Safety Division engaged in several email exchanges and phone calls during this time period.

Appendix D contains corrected copies of the Puc E-33 Forms.

The Company is not aware of any scheduled calls initiated by state government during the restoration period.

The New Hampshire Department of Safety did not issue a Declaration of Emergency. However, two press releases were issued and the NH Emergency Operations Center was opened. Also, the New Hampshire Cybersecurity Functional Exercise scheduled for March 8, 2018, was postponed.

The Company opened its Municipal Contact Center on Wednesday, March 7, at 1200 hours. The Center remained opened until Sunday, March 11 at 1900 hours. The Company communicated directly with municipal officials and first responders during this time period. Their concerns, in addition to customer outages, were the blocked roads due to tree damage and wires down.

Liberty Utilities significantly ramped up communications with customers using its social media pages (Facebook and Twitter). The Company pushed out regular general updates to all followers every 2-3 hours and attempted to respond to all customer inquiries during normal business hours. After hours, the Company reduced the individual customer responses to just emergency situations. The Company posted photos of damage so customers could see the magnitude of the damage. Liberty Utilities also utilized its website and provided updates every 3-4 hours. Customer Outage Maps were available to the public throughout the storm via the Company web-site. This was not the first time that the Company made such extensive use of social media to communicate with the public. The response by customers was positive. Customers were made aware of the Company's restoration efforts and knew that their particular situation was not being ignored.

3.3 Restoration Process

- **Resource Management**

On Monday morning, March 5, the Incident Commander began securing Company and on-property line and tree crews. Liberty Utilities had released contractor crews to work out of state to assist another utility during Winter Storm Riley. The Company requested that they return to New Hampshire by Wednesday morning ready to work.

On Tuesday morning, March 6, the Company requested ten distribution line crews and ten tree crews from the NAMAG. At that time, there were outstanding requests for approximately 1,210 distribution line crews and 22 tree crews by other NAMAG members. These outstanding requests were the result of back to back to back storms impacting the same operators in a short time period. The Company knew on Tuesday that we would not be able to pre-stage NAMAG crews.

By Wednesday evening, March 7, the Company was beginning to experience a Type 2 Event – Major Impact Event (Comprehensive Support). Such events are characterized as having up to 200 Locations of Trouble and up to 8,400 customer outages. As the Company received more information that evening, it monitored restoration efforts and dispatched the line and tree crews when and where it was safe to do so.

How and when Liberty Utilities utilized its crews is reflected in the Puc Form E-33 reports. As previously stated, these were voluntarily provided to the NHPUC Safety Division throughout the storm. An error was discovered in some reports and corrected ones are in *Appendix D*. The reports include the NAMAG crews secured on Friday, March 9.

- **Damage Assessment and Wires Down**

Electric Operations, with assistance from Gas Operations and Engineering personnel, performed all damage assessment and wires down requests. This effort began as soon as the first no power calls came in on Wednesday evening.

Additionally, the Company introduced the iRestore First Responder Smartphone App to the local fire and police departments in its electric service territories during the month of February 2018. The App enables first responders to easily send geo-tagged photos of damaged equipment directly to the Liberty Utilities. The first successful use of the App occurred during Storm Quinn. Police and Fire Dispatch Centers are still required to call Liberty Utilities Dispatch Center to report damaged equipment or emergencies. The use of the App is not limited to storms.

- **Safety**

Liberty Utilities did not experience any safety related incidents during the storm. Each morning, a written storm safety briefing was issued to all Liberty Utilities personnel with a storm assignment and to the mutual aid contractors working in the service territory.

During the five day event, there were:

- 150 employees working,
- 100 contractors working,
- 11,000 hours worked, and
- 0 safety incidents

concerning employees, contractors, customers, first responders, or the public.

4. Summary

The Settlement Agreement in Docket No. DG 06-107, approved by Order No. 24,777, requires Granite State to establish a storm reserve fund. The fund is used to pay for all of the operations and maintenance costs incurred by Granite State as the result of major storms. A major storm is defined as a severe weather event or events causing 30 concurrent troubles (i.e., interruption events occurring on either primary or secondary lines) and 15 percent of customers interrupted or 45 concurrent troubles.

The Settlement Agreement in Docket No. DE 13-063, approved by Order No. 25,738, allows Liberty Utilities to charge costs to the storm reserve if the weather forecast shows an EII Level of 3 or greater with a high probability of occurrence. The costs include pre-staging of crews, standby arrangements with external contractors, incremental compensation of employees, and other costs that may be incurred to prepare for a qualifying major storm.

There were 153 interruption events during the 91-hour period impacting 20,168 customers (or 46%). Therefore, the storm met the criteria for a major storm designation, and the costs are being charged to the storm reserve fund.

The Company has created a Storm Timeline of Events for the storm, which is contained in *Appendix G*.

Appendix *F* contains a listing of all of the customer interruptions or Events.

5. Appendices

- A. Weather Sentry DTN Energy Event Index Tables*
- B. Liberty Utilities Daily Weather Summaries*
- C. Liberty Utilities Storm Planning Reports*
- D. NH Puc E-33 Forms*
- E. Storm Call Documents*
- F. All Events*
- G. Storm Timeline of Events*

SAFETY MESSAGE

WEATHER

A. Current Weather Report

- A. Source:
- B. Time:
- C. Description:

B. Current Weather Scenarios

- A. Best Case:
- B. Worse Case:
- C. Most Likely Case:

C. Energy Event Index Forecast

- A. Event Level:
- B. Confidence Level:

Energy Event Index Definition

No Leaves (Nov 1 - Mar 31)

EEI	Wind Speed	Wind/Gust	Snow	Ice
1	< 40 mph	< 45 mph	< 6 in.	< 1/10 in.
2	>= 40 mph	>= 45 mph	>= 6 in.	>= 1/10 in.
3	>= 50 mph	>= 55 mph	>= 8 in.	>= 3/8 in.
4	>= 60 mph	>= 70 mph	>= 12 in.	>= 1/2 in.
5	>= 70 mph	>= 85 mph	>= 24 in.	>= 1 in.

Confidence Level	
Low	<30% chance the most likely EEI level remains at that level through the event
Medium	30-60% chance the most likely EEI level remains at that level through the event
High	>=60% chance the most likely EEI level remains at that level through the event

*Note: Confidence is NOT a measure of probability of an event occurring; That information can be found in the text product. Confidence is a measure of how likely the forecast EEI level will stay at that level from now through the event, or a way to measure the potential for variability in the forecast. So for example, if it is Monday and there are EEI-2 gusts forecast on Wednesday with high confidence it means the following: There is a >=60% chance the most likely forecasted gusts will remain EEI-2 with all updates from now through Wednesday.

Action Items:

SITUATION ASSESSMENT

1. Has the Director of Electric Operations declared that the Company is in Storm Preparation mode?

Yes No

A. Date:

B. Time:

2. Expected Event Type As Of Meeting Time

(Note: See Attachment 1)

A. Best Case: Choose an item.

Customers Impacted -

B. Worse Case: Choose an item.

Customers Impacted -

C. Most Likely Case: Choose an item.

Customers Impacted –

3. Expected Event Impact As Of Meeting Time

A. Impact Date: [Click here to enter a date.](#)

B. Impact Time:

C. Impact Duration:

D. Impact Location

E. Impact Description:

4. Will the Event occur during a Holiday or over a Weekend?

5. Does the NHPUC Safety Division anticipate a Wide-Scale Emergency?

Has the NHPUC notified Liberty Utilities?

Has the NHPUC named the Event per Puc 307.08 (c)?

(Note: Puc 302:24 defines "Wide-Scale Emergency" as an event that is an event which results in, or is or expected to result in:

(a) a sustained interruption of electric service to 10% or more of Liberty Utilities customers and restoration of electric service to any of these customers takes more than 24 hours; or

(b) the federal, state or local government declaring an official state of emergency in Liberty Utilities service territory and the emergency involves an interruption of electric service.)

6. Are there any Abnormal Conditions currently on the Electric Distribution System that need to be addressed before the Event?

Action Items:

RESOURCE REQUIREMENTS

Notes: A crew generally consists of two people (2 FTEs) with a truck and equipment.

Line Crews: Responsible for switching and repair of equipment and hardware and the final energizing of the line.

Digger Crews: Responsible for replacing utility poles.

Tree Crews: Responsible for removing and relocation of downed trees and limbs to eliminate safety hazards.

On Property Crews: Outside contractor crews currently working in state for Liberty Utilities at the time of the event.

Foreign Crews / Mutual Aid Crews: Outside company or contractor crews requested by LU through NAMAG.

1. Expected Company Resources Required to Restore Electric Service As Of Meeting Time

(Liberty Utilities Blue Sky staffing level is 13 crews.)

	<u>Lebanon</u>	<u>Salem</u>	<u>Charlestown</u>	<u>Londonderry</u>	<u>Total</u>
LU Line Crews					
On Property Line Crews					
Additional Contractor Line Crews					
LU Tree Crews					
Troubleshooters					
On Property Tree Crews					
Additional Contractor Tree Crews					
On Property Digger Crews					
Additional Contractor Digger Crews					
Additional Electric Controllers					
Additional Electric Dispatchers					
Additional Customer Service Representatives					

Has the Company canceled vacation for employees?

Has the Company notified employees to be on standby?

Has the LIBERTY UTILITIES – ELECTRIC OPERATIONS ON-CALL SCHEDULE been issued?

2. Expected Foreign / Mutual Aid Resources Required to Restore Electric Service As Of Meeting Time

	<u>Lebanon</u>	<u>Salem</u>	<u>Charlestown</u>	<u>Total</u>
Foreign Line Crews				
Foreign Tree Crews				
Foreign Digger Crews				

3. North Atlantic Mutual Assistance Group (NAMAG)

Has Liberty Utilities initiated a Joint Mobilization Conference Call through NAMAG? _____

Has another operator initiated a Joint Mobilization Conference Call through NAMAG? _____

What is the Liberty Utilities status at the time of the meeting?

Holding _____ Who made the decision? _____

Requesting _____ Who made the decision? _____

Offering _____ Who made the decision? _____

Has Liberty Utilities requested assistance from neighboring utilities? _____

(See NAMAG exception to Rules of Engagement if a single impact for a short duration.)

4. Expected Outside Contractors Required to Perform Other Services As Of Meeting Time

Service: Snowplow _____ Service: _____

Contractor: _____

Contact: _____

Service: Food _____ Service: _____

Contractor: _____

Contact: _____

Action Items:

PRE-STAGING of CREWS, PERSONNEL and MATERIALS

Has the Company considered the need to pre-stage crews?

Who made the decision?

When?

Date Pre-Staging is expected?

Time?

Action Items:

COMMUNICATIONS – Action Items

- A. To Company Employees:
 - Operations (Example: Use radio instead of cell phone.)
 - Non Operations
- B. To Governor / State Government / NH WebEOC:
- C. To NHPUC Safety Division:
- D. To Cities / Towns:
 - Are there any Storm Conference Calls scheduled:
- E. To Customers / Critical Care Customers:
- F. To Public:
- G. To NAMAG & Other Industry Groups:
- H. Other Pole Attachees:

REPORTS – Action Items

- A. Prepare internal Storm Planning Report.
- B. File Puc Form E-33 prior to the onset of any anticipated Wide-Scale Emergency.
- C. Continue to prepare and file all other required reports.

ADMINISTRATION

- A. Send all storm related information and documentation to “SM NH Storm Duty”.
- B. See CQ&EM folder on Liberty Utilities East site for Emergency Management Forms and Reports.
- C. Planning and Preparation Activities Recoverable (if EEI Level 3 or greater with a High probability)
- D. Storm/Event Accounting:

Description	GP Expense Job	GP Capital Job	GP VM Job
Storm Event EII Level			

Storm Contingency Fund (CFID 1748)

The Settlement in Docket No. DG 06-107, Exhibit GSE-7, approved by Order No. 24,777, calls for Granite State to establish a storm contingency fund. The fund would be used to pay for all of the operations and maintenance costs incurred by Granite State as the result of major storms. A major storm is defined as a severe weather event or events causing 30 concurrent troubles (i.e., interruption events occurring on either primary or secondary lines) and 15 percent of customers interrupted or 45 concurrent troubles.

The Settlement in Docket No. DE 13-063, approved in Order No. 25,738, entitles Liberty Utilities to recover certain costs if the weather forecast shows an EII Level of 3 or greater with a high probability of occurrence. The costs include pre-staging of crews, standby arrangements with external contractors, incremental compensation of employees, and other costs that may be incurred to prepare for a qualifying major storm.

INCIDENT COMMAND SYSTEM POSITIONS – Comments / Questions

1. Incident Commander:

2. On-Scene Commander / Regional Commander:

Guest Passcode: **430980**

Host Passcode: **4309805**

ATTACHMENT 1

The following are guidelines to determine the severity of Emergencies and their Operating Conditions for the Company.

The guidelines are intended to be consistent with Table 306-1 in NH Puc 306.09:

Emergency Response Standards and Electrical Outage Restoration

- Type 5 Small Impact Event** (*Localized Response Condition / Normal Operations*) - System activity is normal with response coordinated with local on-call personnel. Incident Command Structure not activated.
(0 - 840 customers)

- Type 4 Moderate Impact Event** (*Heightened Alert*) - The severity within a Region(s) is (are) such that restoration activities are generally accomplished within a 24 hour period. This may require assistance from another Region or contractors. Incident Command Structure may be activated at the Region level.
(840 - 2100 customers)

- Type 3 Serious Impact Event** (*Enhanced Support*) - The severity within a Region(s) is (are) such that restoration activities are generally accomplished with assistance from other Regions and contractors within 24 to 48 hour period. Incident Command structure activated at the Regional level.
(2100 - 4200 customers)

- Type 2 Major Impact Event** (*Comprehensive Support*) – The severity within the Region (s) is (are) such that restoration activities are generally accomplished with assistance from other Regions and contractors within a 48 to 144 hour period. This may require mutual assistance from other utilities. Incident Command Structure activated at the Regional level and may be activated at the System level.
(4200 - 8400 customers)

- Type 1 Catastrophic Impact Event** (*Emergency Support*) – The severity within a Region(s) is (are) such that restoration activities are accomplished with assistance from other Regions, contractors and require mutual assistance from other utilities. Restoration activities will generally require 48 to 240 hour period. The Incident Command Structure will be activated at the Regional and System levels.
(>8400 customers)

Puc 306.09 (g): Each ERP shall incorporate projected event levels consistent with Table 306-1.

Table 306-1			
Utility	ERP Event Level	% Customers Out	Outage Duration (Hrs.)
	5	≤2	<12
	4	>2≤5	0-24
	3	>5 ≤10	24-48
	2	>10≤20	48-144
	1	>20	48-240

Energy Event Index Definition

No Leaves (Nov 1 - Mar 31)

EEI	Wind Speed	Wind/Gust	Snow	Ice
1	< 40 mph	< 45 mph	< 6 in.	< 1/10 in.
2	>= 40 mph	>= 45 mph	>= 6 in.	>= 1/10 in.
3	>= 50 mph	>= 55 mph	>= 8 in.	>= 3/8 in.
4	>= 60 mph	>= 70 mph	>= 12 in.	>= 1/2 in.
5	>= 70 mph	>= 85 mph	>= 24 in.	>= 1 in.

Confidence Level	
Low	<30% chance the most likely EEI level remains at that level through the event
Medium	30-60% chance the most likely EEI level remains at that level through the event
High	>=60% chance the most likely EEI level remains at that level through the event

*Note: Confidence is NOT a measure of probability of an event occurring; That information can be found in the text product. Confidence is a measure of how likely the forecast EEI level will stay at that level from now through the event, or a way to measure the potential for variability in the forecast. So for example, if it is Monday and there are EEI-2 gusts forecast on Wednesday with high confidence it means the following: There is a >=60% chance the most likely forecasted gusts will remain EEI-2 with all updates from now through Wednesday.

Action Items:

SITUATION ASSESSMENT

1. Has the Incident Commander mobilized the Company resources?

Yes No

A. Date:

B. Time:

2. Event Impact As Of Meeting Time

A. Impact Location

B. Impact Description:

3. Event Type As Of Meeting Time

A. Best Case: Choose an item.

Customers Impacted -

B. Worse Case: Choose an item.

Customers Impacted -

C. Most Likely Case: Choose an item.

Customers Impacted -

4. Has the Governor declared a State of Emergency?

5. Has the State opened its Emergency Operations Center?

6. Has the NHPUC Safety Division declared a Wide-Scale Emergency?

7. Are there any known road closures on the NH WebEOC?

8. Damage Assessment Summary As Of Meeting Time

	<u>Lebanon</u>	<u>Salem</u>	<u>Charlestown</u>
Time of First Outage

COMMUNICATIONS – Updates

- A. To Company Employees:
- B. To Governor / State Government / NH WebEOC:
- C. To NHPUC Safety Division:
- D. To Cities / Towns Storm Conference Call:
- E. To Customers / Critical Care Customers:
- F. To Public:
- G. To NAMAG & Other Industry Groups:
- H. To Other Pole Attachees:

REPORTS – Action Items

- A. Prepare internal Storm Planning Report.
- B. Prepare internal Customer Outage Reports.
- C. File Puc Forms E-33 and E-36A if a wide scale emergency.
- D. Continue to prepare and file all other required reports.

ADMINISTRATION

- A. Send all storm related information and documentation to "SM NH Storm Duty".
- B. See CQ&EM folder on Liberty Utilities East site for Emergency Management Forms and Reports.
- C. Is this a Qualifying Storm Event?
- D. Storm/Event Accounting:

Description	GP Expense Job	GP Capital Job	GP VM Job
Storm Event EII Level			

Storm Contingency Fund (CFID 1748)

The Settlement in Docket No. DG 06-107, Exhibit GSE-7, approved by Order No. 24,777, calls for Granite State to establish a storm contingency fund. The fund would be used to pay for all of the operations and maintenance costs incurred by Granite State as the result of major storms. A major storm is defined as a severe weather event or events causing 30 concurrent troubles (i.e., interruption events occurring on either primary or secondary lines) and 15 percent of customers interrupted or 45 concurrent troubles.

The Settlement in Docket No. DE 13-063, approved in Order No. 25,738, entitles Liberty Utilities to recover certain costs if the weather forecast shows an EII Level of 3 or greater with a high probability of occurrence. The costs include pre-staging of crews, standby arrangements with external contractors, incremental compensation of employees, and other costs that may be incurred to prepare for a qualifying major storm.

INCIDENT COMMAND SYSTEM POSITIONS – Comments / Questions

- 1. Incident Commander:
- 2. On-Scene Commander / Regional Commander:

Appendix G Storm Timeline

THIS PAGE INTENTIONALLY LEFT BLANK

6. NHPUC Information Requests dated April 6, 2018

6-1. ***Number of services replaced.***

Approximately 15 services were replaced as a result of Storm Quinn. These numbers may change as review of storm charges continue. There were approximately 80 services that required to be disconnected so that customer repairs could be made and later inspected. Several other services were required to be re-hung or reconnected after extensive damage from fallen trees or limbs. There were 320 reported wires down from the primary and secondary.

6-2. ***Amount of secondary wire replaced (in feet).***

Approximately 1,800 feet of secondary wire was replaced as a result of Storm Quinn.

6-3. ***Amount of primary wire (in feet, indicating size and 1 ph, 2ph, 3ph, mainline).***

Several sections of primary wire throughout the southern NH territory needed to be reconnected or re-hung due to the extensive amount of fallen trees and tree limbs in the area. Several of these sections required a minimal amount of primary wire added to splice the conductors back together. It is unknown at this time the amount of primary wire that was used for these efforts but as review of storm charges continue more details will be available. There were 320 reported wires down from the primary and secondary.

6-4. ***Number of transformers replaced.***

Two.

6-5. ***Number of poles replaced.***

Eleven.

6-6. ***Number of cross arms replaced.***

Eleven.

6-7. ***Number of environmental impact events.***

One.

6-8. ***Restoration costs (indicate if finalized or estimated to date).***

Estimated to date is \$1.15 million.

6-9. ***The peak number of customer without power by date and time, including an hourly spreadsheet of the number of customers without power per town throughout the duration of the storm.***

The peak number of customers without power was 17,998, which occurred on March 8th between the hours of 0600 and 0700. During the peak of the storm approximately 85% of the southern New Hampshire territory was without power.

This storm is the second worst storm event for Liberty since the PUC began tracking major events. Total customers impacted by Storm Quinn in the Salem Area by Town are as follows: Atkinson (100% interrupted); Salem (81% interrupted); Derry (100% interrupted); Windham (99% interrupted); and Pelham (98% interrupted). 99% of all customers interrupted were restored by March 10th at 1900 hours or about 3 days after the storm began.

6-10. Detailed discussion and timeline of executed restoration and how the order of restoration compares with the 2017 Liberty Utilities Emergency Response Plan restoration prioritization.

Outage restoration was executed in accordance with Liberty's Electric Emergency Management Plan Appendix I - Restoration of Service. The Plan reads as follows:

Emergency work is done and service is restored generally in the order of priority below:

1. Live Wires and Extreme Hazards
2. Transmission
3. Substations
4. Critical Facilities
5. Life Support Customers
6. Primary Circuits
7. Secondary Circuits
8. Final Circuit Sweep
9. Permanent Repairs
- 10.

At the recent Municipal Meetings, the Company explained the restoration steps in Quinn as follows:

1. Life Safety – Top Priority is always the life safety of the public & employees
2. Electric Infrastructure: Sub-Transmission lines/substations: Transmission Lines in New Hampshire supplying Liberty Utility Substations are owned by National Grid.
3. Utility Defined Critical Facilities: Hospitals, police/fire stations, water supply, sewage treatment facilities (identified by Municipal Officials)
4. Circuit Backbones: Main line distribution circuits which feed lateral lines
5. Lateral Feeders: Large blocks of customers and/or whole neighborhoods, largest number of customers in the minimum amount of time
6. Transformers/Secondary Circuits
7. Individual House Services

6-11. Peak number of restoration crews (excluding damage assessors and tree crews) that were on the system at one time.

Liberty Utilities had:

- 9 Company restoration crews

- 8 on-property contractor crews
- 15 NAMAG crews

Contractor crews worked during day-time hours.
Company crews were split between day-time and night-time to provide 24 hour coverage.

6-12. A detailed discussion and associated timeline should be provided that describes the number of crews on the system prior to the storm, the number of crews planned for and needed for storm restoration efforts, all outgoing attempts to attain additional contractor or mutual aid crews, the number of crews offered by other contractors and utilities throughout the restoration event, and when crews were in New Hampshire and accepted by Liberty.

On Monday morning, the Incident Commander began securing Company and on-property contractor crews. Liberty Utilities had released contractor crews to assist a utility in another state during Winter Storm Riley. Liberty Utilities requested that they be returned ready to work by Wednesday morning. On Tuesday morning, the Company requested 10 line crews and 10 tree crews through NAMAG. However, none were available. On Tuesday afternoon, the Company informed the NHPUC Safety Division. On Thursday morning, the NHPUC Safety Division informed the Company that there were Canadian crews available from the NHEC. The Company contacted NHEC and NAMAG, but could not confirm this. On Thursday afternoon, the Company secured line crews from Evansville, Indiana, and Madison, Wisconsin, and tree crews from National Grid. A short time later, the Company secured crews from Vermont and canceled the Indiana and Wisconsin crews once we learned they were tree crews only. On Friday morning, the Company secured line crews from PSNH, Unitil, and NHEC. Initially, the Company turned down the Unitil and NHEC crews but reconsidered within the hour after the supervision, field coordination, and safety concerns were resolved. The Company informed the NHPUC Safety Division. The crew counts were provided in the filed reports. As it turned out, the crews provided by Unitil were the Canadian crews.

6-13. Detailed discussion of storm event level planning prior to the storm with respect to line resource requirements, existing in-house line resource deficiencies, and external line contractors required.

As with all potential electric events, before the initial call with the 60 invitees, there is a smaller call with Senior Management and Electric Operations. Appendix H of the Electric Emergency Plan contains a 3 Day Checklist. Items are discussed as necessary.

This smaller call or in-person meeting is generally held at the earliest notice of pending inclement weather. Because of the back to back to back storms Riley, Quinn, and Skylar, there were multiple opportunities to discuss available resources from an offering, holding, and requesting point of view.

6-14. Date, time, and location of the first customer who lost power associated with the storm and the date, time, and location of the last customer who had power restored associated with the storm.

First customers to lose power as a result of Storm Quinn occurred at 2141 hours on March 7 in the Zion Hill Area of Salem. The last customer to be restored occurred on March 11 at 1400 hours in the Castle Hill Rd Area of Windham.

6-15. A timeline of when and where the first-level damage assessment was initiated, entered into the OMS, and completed, including the quantity of resources utilized in the field, non-storm (day to day) roles of those field personnel assessing the damage, years of electric utility damage assessment experience; indicate which assessors had multiple roles within the Incident Command System.

Electric Operations personnel began damage assessment as soon as the first customers began to lose power on Wednesday evening. Those personnel with storm assignments in damage assessment began working early on Thursday morning. Both groups continued until Sunday morning.

The Damage Assessment responsibilities and procedures are detailed in Appendix J of the Electric Emergency Plan. Those personnel assigned to Damage Assessment can be found in the documents contained in *Appendix E* of this report.

6-16. The process followed by damage assessors and the Damage Assessor Coordinator during the Company's phase 1 assessment and any applications or equipment that were utilized to expedite the assessment of damage through the OMS, including the use of any mobile applications or other non-paper process.

The damage assessors followed the procedures detailed in Appendix J of the Electric Emergency Plan.

6-17. Detailed discussion, including times and duration, regarding any problems experienced with the company's OMS system, website outage map, website crew assignment, and outage reporting including attempts to repair problems during the event.

Initially, the amount of incoming customer calls caused the OMS system to predict upstream devices from actual affected devices. This resulted in higher predicted interruptions being reported in the website outage map. After updating the prediction mode in the system, Liberty was able to correct these reported amounts and the management of incidents in the OMS system improved.

During the latter stage of the storm some incidents had to be re-created to reflect accurate customer counts in the system. This caused the customer counts to increase temporarily in the outage map as these incidents were recreated and managed through completion. This issue took several hours to correct.

The outage management system had issues with reporting hazards (wires down; tree/limbs) due to an unknown bug in the system with unknown regions. This caused the wires down to be managed and tracked manually by the wires down team. This issue has since been resolved

6-18. *Details of any discussions Liberty had with Town of Salem officials, such as Emergency Directors or First Responders, regarding the provision of electric power to mitigate the need for an emergency shelter to be opened.*

Liberty Utilities opened its Municipal Contact Center on March 7 at noon. Fire Chief/EMD Paul Parisi and Assistant Chief Lawrence Best came to the Company's office twice a day throughout the restoration to discuss road closures and public safety.

On March 8, the Company reviewed the priority customers that had no power, as well as neighborhoods without power, and the estimated restoration times. Areas that were able to be restored through switching were identified, as were areas that would remain out overnight. Due to the large amount of outages in Salem and the estimated restoration times, the Town officials decided to open a shelter at the Ingram Senior Center on March 8 at 7 p.m. The Company kept the Town officials abreast of the areas that were restored on an ongoing basis.

The Company received 113 Priority 2 (Hindering Emergency Operations) calls during the Storm. Included were 14 "Wires Down" alerts through the iRestore App, which were submitted via local Fire and Police Personnel. During restoration of the storm, Liberty Utilities met regularly and worked closely with different chiefs of emergency personnel from different towns to discuss road closures and prioritization of restorations.

Note that on March 29, 2018, the Company hosted its annual Municipal Meetings as required by NH Puc 306.09. One agenda item was how the Company restores power to customers after a storm. The Company validated the Town of Salem's critical infrastructure listing. The NHPUC Safety Division declined the Company's invitation to attend so the Company forwarded a copy of the presentation to the Safety Division after the meeting.

6-19. *Detailed discussion of Liberty's attempts to facilitate restoration with National Grid of the 23kV supply line originating at Pie Hill in Methuen and providing power to the Spicket River substation.*

The loss of the National Grid 23kV-2376 Supply Line to Spicket River occurred on March 8 at approximately 3:50 a.m. Initially, National Grid indicated that the loss of supply was due to issues with the 115kV source at their Ward Hill substation. Liberty was not aware there was another issue, trees on primary, on the 23 kV Supply line until the morning of March 9 when a helicopter patrol was performed. Liberty immediately dispatched tree crews to address this issue. Liberty had performed a foot patrol of a portion of the 23 kV right of way and no tree hazards were identified at the time.

Throughout the duration of this outage, both Liberty Storm Room personnel and Liberty Control Room personnel were in contact, via phone, with National Grid regarding expected restoration of supply lines. Liberty Control Room personnel contacted both National Grid's Distribution and Transmission Control Rooms requesting updates. Liberty Storm Room Personnel contacted National Grid's Transmission Account Management Team regarding this outage and expected restoration.

6-20. *The Commission's understanding is that the restoration of that substation feed would significantly restore the affected circuits out of the Spicket River substation and shorten outage durations in the North Main Street and Main Street areas accordingly.*

The Commission is correct.

6-21. *Discussion of restoration efforts coordinated with National Grid, including switching attempts employed by Liberty to restore power within Liberty's distribution system in lieu of National Grid's prolonged restoration efforts, with associated dates and times of each step of switching.*

On March 8 at approximately 11:30 a.m., a portion of the 13L2 feeder was restored via the Salem Depot 9L3 feeder. On March 8 at approximately 4 p.m., the Spicket River 13L3 feeder was restored via the Olde Trolley 18L2 feeder. Restorations of the Spicket River feeders were delayed due to multiple lockouts in the adjacent areas which also prevented further restorations of these feeders.

6-22. *Discussion should include a description of the Liberty circuits involved in potential switching, significant customers on those circuits, and the date and time when power was finally restored to the Spicket River substation.*

See the response to Number 21 for a portion of this response. The 2376 Supply Line was restored on March 9 at approximately 2 p.m.

6-23. *Include any communications with National Grid and all memoranda of understanding or efforts that have been memorialized to date regarding actions with National Grid to minimize outage durations associated with future interruptions of this line.*

There are no known communications or memoranda.

6-24. *List the names and roles of each employee (normal positions/titles), their roles within the Incident Command System, and the number of years of their experience within the role assigned.*

The employees with roles within the ICS as of March 5, 2018, are listed on the documents in *Appendix E*. These documents are updated after each Event. The start and end dates of the assignments are not tracked. Day One for Liberty Utilities was July 3, 2012. Therefore, everyone on the list has less than six years' experience in their assignment as Liberty Utilities personnel. Some however bring experience from other utilities.

Additionally, there has been some turnover in the ICS assignments due to some individuals not meeting the Company expectations.

Nonetheless, as a result of drills, tabletop exercises, and actual events over the past six years, all assigned employees have an understanding of their roles.

See the table below:

	Drills	Table Top Exercises	Municipal Meetings	Actual Events
2018			March 28 – Lebanon March 29 - Salem	Jan 3-4: Snow (Grayson) Feb 6-7: Snow (Liam) Mar 2-3: Wind (Riley) Mar 7-11: Snow (Quinn) Mar 13-14: Snow (Skylar) Mar 20-22: Snow (Toby) Apr 4-5: Snow (Wilbur)
2017	August 30		April 11 - Concord	Jan 23-24: Wind/Snow Feb 8-9: Snow Feb 10-12: Snow (Orson) March 13-15: Snow (Stella) March 30-April 1: Snow June 19: Thunderstorm Oct 30-31: Wind Dec 24-25: Ice
2016	May 24 (NAMAG) Aug 17 (NAMAG)	November 28 March 31 (NGRID-Transmission)	April 5 – Salem April 12 - Lebanon	January 20: Wind/Snow February 4-5: Snow February 15: Snow March 19: Wind/Snow April 3: Wind/Snow Sept 9: Wind/Rain October 6: Hurricane (Matthew) December 28-29: Snow
2015	December 9	December 15	March 27 - Lebanon March 30 - Londonderry	January 2-4: Ice/Snow January 26-27: Ice/Snow February 1-2: Ice/Snow February 13-15: Ice/Snow February 21-22: Ice/Snow October 2: Hurricane December 28-29: Ice/Snow
2014		July 23	March 4 - Lebanon March 5 - Salem	December 8-10: Ice/Snow November 23-28: Ice/Snow
2013			January 29 - Lebanon January 31 - Salem	February 8-10: Blizzard (Nemo)
2012	July 30			October 29-31: Hurricane Sandy

6-25. Identify those employees that hold multiple roles within the Incident Command System.

As shown on the documents in *Appendix E*, most ICS Positions have a Primary, Secondary, and Backup. In some limited situations, a Primary in one position may act as a Backup in another position. For example, once an individual completes their Onboarding Assignment, they may be able to act as a Field Guide.

6-26. Compare and contrast the differences in preparation that Liberty undertook for the prior Northeaster (Coastal Storm "Riley") that occurred on March 2 and 3, 2018, and Winter Storm "Quinn."

As shown in the table below, the storms were not comparable.

Nonetheless, the Company conducted its initial internal storm preparation call and followed the three documents similar to those in *Appendix E*. Once the storm's impact was known, the remaining calls were canceled.

Subject	Riley	Quinn
Dates	March 2 - 3	March 5 - 11
Weather Forecast	Hazardous Weather Outlook	Winter Storm Warning
Type Event	4	2
Planning Reports Issued	1	11
Internal Storm Calls	1	9
NAMAG Storm Calls	3	9

6-27. Include weather event indices used for both storms and note any factors that should be considered when reviewing each storm.

See the above table. From the National Weather Service:

Hazardous Weather Outlook

The Hazardous Weather Outlook will describe potential hazardous weather and hydrologic information of concern in Days 1 through 7.

The outlook contains two segments: One segment for the marine zones and adjacent land-based (i.e., coastal) zones and the other segment for the rest of the land-based zones. Each segment of the HWO will contain 3 sections: short term through Day 1, long term for Days 2-7, and spotter information.

Winter Storm Watch

A Winter Storm Watch is issued when there is the potential for significant and hazardous winter weather within 48 hours. It does not mean that significant and hazardous winter weather will occur...it only means it is possible.

Significant and hazardous winter weather is defined as a combination of:

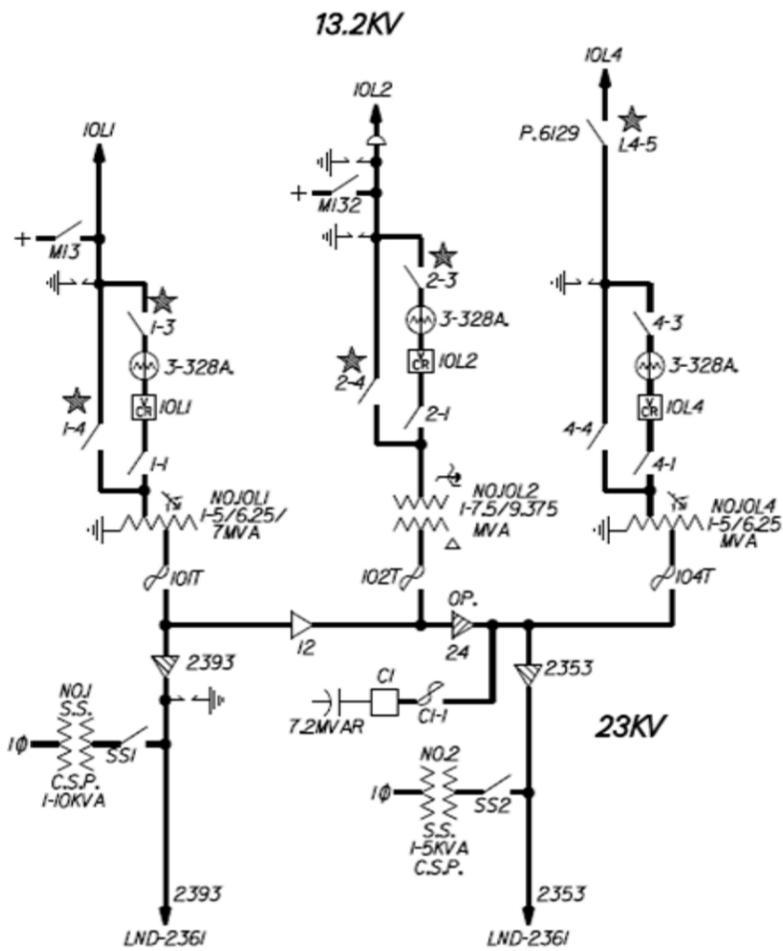

- 1) 5 inches or more of snow/sleet within a 12-hour period **or** 7 inches or more of snow/sleet within a 24-hour period
AND/OR
- 2) Enough ice accumulation to cause damage to trees or powerlines.
AND/OR
- 3) a life threatening or damaging combination of snow and/or ice accumulation with wind.

The snow/sleet criteria for a Winter Storm Watch for the five westernmost counties (Allegany, Mineral, Grant, Pendleton, and Highland) is higher (6 inches or more within a 12-hour period; 8 inches or more within a 24-hour period).

6-28. Please include any other metrics normally included by Liberty within its internal self-assessments.

See Section 2 Overview of Storm.

Barron Ave Station - No 10 - OnLine

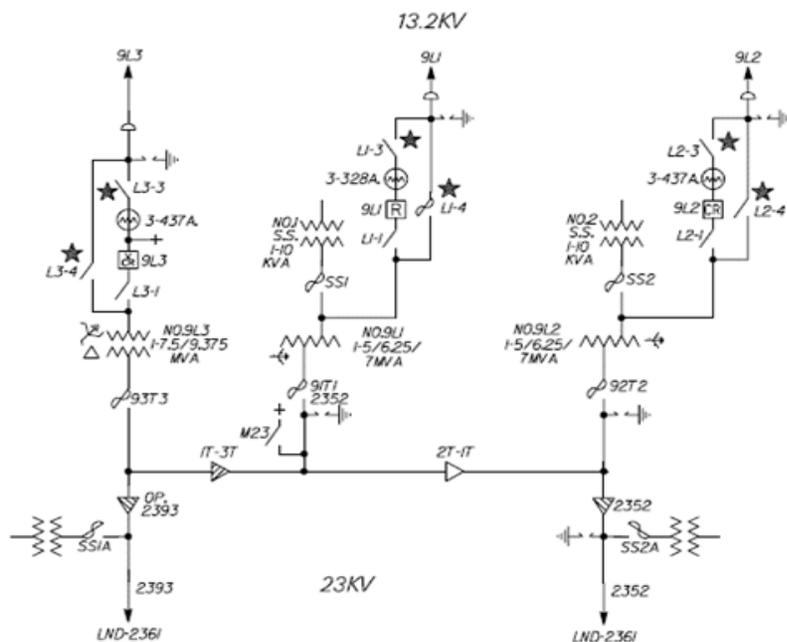

Major Equipment	Average Station Equipment Age 2019
23-13.2 kV Transformer	41
13.2 kv Recloser/Breaker	37
Regulator - Phase A	29
Regulator - Phase B	29
Regulator - Phase C	29

Comments
1 - 10L4 Recloser is at End of Life - No longer supported
2 - 10L4 Regulators are at End of Life - Contact wear, operations by phase -A over 421,000, B over 542,000, C over 559,000 - Live part height does not meet current minimum requirements
3 - 23 kV Airbreak Switches are near End of Life - minimum age 50 years
4 - 10L1 Recloser Model has a higher than normal failure rate
5 - 10L1 Regulators are nearing End of Life - Contact wear - B phase over 270,000 operations, C phase over 195,000 operations
6 - 10L1 Transformer is 57 years old (as of 2006 - 2 of 31 have failed @ NGRID)
7 - 10L1 Transformer bushings have high power factor
8 - 10L4 Transformer is 48 years old (as of 2006 - 5 of 28 have failed @ NGRID)

Feeder	Major Equipment	Equipment Age	Nameplate Rating	Operation Counter 12/31/2019	Comments
10L1	23-13.2 kV Transformer	57	5/6.25/7 MVA		Transformer is 57 years old (as of 2006 - 2 of 31 have failed @ NGRID) Transformer bushing have high power factor
	13.2 kv Recloser	45	560 A, 15.5 kV	702	Recloser Model has a higher than normal failure rate
	Regulator - Phase A	31	7.62 kV, 328 A, 250 kVA	129,148	Regulator nearing End of Life - Contact wear - B phase over 270,000 operations
	Regulator - Phase B	31	7.62 kV, 328 A, 250 kVA	272,517	Regulator nearing End of Life - Contact wear - C phase over 197,000 operations
	Regulator - Phase C	31	7.62 kV, 328 A, 250 kVA	198,762	
10L2	23-13.2 kV Transformer	19	7.5/9.375 MVA
